WASHINGTON

## LETTER OF TRANSMITTAL.

## Department of Commerce, <br> Bureay of the Census, Washington, D. C., June 7, 1924.

SIR:
I transmit herewith the Statistical Athas of the United States. This volume contains the maps and diagrams used for illustrating the reports of the Fourteenth Census, as well as a number of illustrations which have been prepared and publishet in the special and amual reports of the Bureau of the Census.

The text and illustrations comprising this volume were prepared under the supervision of Charles S. Sloane, Geographer of the Census.

Respectfully,
W. M. Steuart,

Director of the Census.
Hon. Herbert Hoover,
Secretury of Commerce.
II

## STATISTICAL ATLAS.

## area EnLMerated at The Folrrteenth census.

## AREA OF ENUMERATION.

The area of enumeration in 1920 embraced the United States proper and the outlying possessions of Alaska. Hawaii, Porto Rico, Guam, Samoa, and the Panama Canal Zone. No provision was made in the Fourteenth Census Act for the enumeration of the Philippine Islands, a census of those islands haring been taken br the Philippine government as of December 31, 1918, nor of the Virgin Islands. for which a special enumeration was made as of Norember 1,1917 . The gross area of the territory under the jurisdiction of the United States in 1920 was 3,735,371 square miles. and its population $117,823,165$, as shown in Table 1. The population was as returned at the Fourteenth Census, taken as of January 1, 1920. for the United States proper and all of the outlying possessions except the Philippine Islands and the Virgin Islands. enumerations of their population being made at the dates specificed above.

In Table 2 is giren the gros- area in square miles of the Ťnited states. including all its outlying posessions. at each enumeration from 1790 to 1020. together with the population: the area-land. water, and total-and the population of the Cnited states, excluding the outlying posessions: and the gross area of the outlying possessions.

## Table 2

thited etates and its ofthitis; possessions.

[^0]Table 3 gives the gross area with the date of annexation of each accession of territory from 1790 to 1920, and per cent distribution of aggregate area and area of the United States.

Plate No. 1 shows the boundaries of the original 13 states and each of the accessions of territory.

${ }^{1}$ Includes drainage basin of the Red River of the North, not a part of any accession, but in the past sometimes considered a part of the Louisiana Purchase.
${ }_{2}$ Less than one-tenth of 1 per cent.
The increase in population from $3,929,214$ at the census of 1790 to $117,823,165$ at the census of 1920 was $113,893,951$, or about 29 persons in 1920 to each person returned at the First Census. During the same period the area was extended from 892,135 square miles to $3,738,371$ square miles. The area, therefore, increased only four times, as compared with a population increase of nearly twenty-nine fold. The gross area, land and water, of the territory under the jurisdiction of the United States at the Fourteenth Census was $3,738,371$ square miles. The outlying territories had an area of 711,582 square miles, constituting 19.0 per cent, or approximately one-fifth of the total area.

In 1790 , at the First Census, the area was 892,135 square miles, less than one-fourth of the present area, and, with the exception of the territory known as

Florida, was confined to the territory lying between the Atlantic Ocean and the Mississippi River, together with the drainage basin of the Red River of the North. The largest accession of territory at any decade was that of the Louisiana Purchase in 1803. During the decade from 1840 to 1850 there were three accessions of territory, aggregating $1,204,596$ square miles, which, with the area of the Louisiana Purchase, covered an area of over $2,000,000$ square miles. The annexations made in other years, with the exception of Alaska, were smaller in area, but more densely populated.
Table 4 shows at each census the population, accumulative increase, per cent of increase from 1790, land area, and number of persons per square mile for the United States, exclusive of its outlying possessions. The increase in population in 1840, after 50 years of growth was 334.4 per cent, having increased a little over four times. The increase for 100 years, to 1890, was 1,502 per cent, or there were then in the United States 16 persons where in 1790 there was one person. The increase for 130 years, to 1920 , was $2,590.4$ per cent ; in other words, there were 27 persons in continental United States to each person returned in 1790. The land area has increased almost three and onehalf times, while the population per square mile has increased nearly eight times, the increase in density from 1900 to 1910 being greater than during any other decade. The increase and decrease in density of population is represented by Diagram 1, Plate No. 139.

The land area of each of the states and of the entire United States is given in Table 5.

| Table 4 <br> CENSUS YEAR. | Population of continental United States. | Accumulative increase. | Per cent of increase from 1790. | Land area in square miles. | Population per square mile. |

${ }^{23}$ Includes 314 square miles ceded to the Tnited States by the state of New York in 1781 and sold to the state of Pennsylvania in 1792.
${ }^{24}$ Then known as "territory southwest of the Ohio River"; includes 5,290 square
miles of territory ceded to the United States by the state of South Carolina in 1787 miles of territory ceded to the United States by the state of South Carolina in 1787 ${ }_{25}$ Decrease of 46 square miles due to building of Pathfinder and Shoshone Reser 26
${ }_{26}$ Then named territory of Louisiana.

## GEOGRAPHIC DIVISIONS.

In making comparisons of the growth in population, manufactures, and agriculture for groups of states, it has been found of great adrantage to divide the United States into certain groups termed geographic divisions. The grouping of the country by geographic divisions is a natural one, and by the aid of it certain characteristic features in the development of groups of states are brought out. At the Fourteenth Census the United States was divided into nine geographic divisions, the boundaries of which are shown on Plate No. 2. The states comprised in each division are as follows:

## NEW ENGLAND DIVISION.

Maine.
New Ilampshire.
Vermont.
Massachusetts. Comnecticut.
MIDDLE ATLANTIC DIVISION.
New York. New Jersey. Pennsylvania. EAST NORTH CENTRAL DIVISION

Ohio.
Indiana.

Illinois.
Michigan.

## CENTERS AND MEDIAN LINES.

## CENTER OF POPULATION.

After the decennial census has been completed it is of great interest to note the direction in which the center of population has moved during the decade, the movement being shown by the change in its location. On the basis of the Fourteenth Census returns the center of population and the median limes for continental United States have been determined for January 1, 1920. In these calculations no account is taken of the territory and population of Alaska and of other noncontiguous territory. The location of the center at the dates of the several censuses, 1790 to 1920, and the movement of the point from decade to decade are indicated in the accompanying tables and Plates 120 to 138 , inclusive, which include, also, a map on which are drawn the median parallel of latitude and the median meridian of longitude, 1920.

A somewhat technical significance, different from that frequently given to it, attaches to the term "center of population," as used in census publications. The center is often understood to be the point of intersection of a north and south line, which divides the population equally, with an east and west line, which likewise divides it equally. This point of intersection is, in a certain sense, a center of population; it is here, however, designated the median point to distinguish it from the point technically defined as the center.

There are points different in character which may be termed "center of population," but at each census the term "center of population" has been applied to the point which may be considered as the center of gravity of the United States; in other words, the point upon which the United States would balance, if it were a rigid plane without weight and the population distributed thereon, each individual being assumed to have equal weight and to exert an influence on the central point proportional to his distance from the point. The pivotal point, therefore, would be its center of gravity and is the point referred to by the term used in the census as "center of population." This is sometimes confused with another point which we term the "median point." Continuing the above analogy it may be noted that the median point, which may be described as the numerical center of population, is in no sense a center of gravity. In determining the median point distance is not taken into account and the location of the units of population is considered only in relation to the intersecting median lines-
as being north or south of the median parallel and east or west of the median meridian. It is evident that extensive changes in the geographical distribution of the population may take place without affecting the position of the median point. In this respect the median point differs essentially from the center of population, which responds to the slightest population change in any section of the country. To illustrate: Since the median point lies east of Minnesota, a million persons could move from Minnesota to Oregon without affecting the median point, while the movement of 500 persons from one town in Indiana to another, across the north and south line passing through the median point, would change the location of the point. On the other hand, a movement of a million persons from Minnesota to Oregon would have a very considerable effect on the center of population, since, in terms of the above analogy, the pressure exerted by each individual would increase in proportion to the distance traveled away from the center. If all the people in the United States were to be assembled at one place, the center of population would be the point which they could reach with the minimum aggregate travel, assuming that they all traveled in direct lines from their residence to the meeting place. No such statement holds true of the median point.

## METHOD OF DETERMINING THE CENTER OF POPULATION.

In making the computations for the location of the center of population it is necessary to assume that the center is at a certain point. Through this point a parallel and a meridian are drawn, crossing the entire country. In making the computations for 1920, the same point was selected as in 1910; this intersection was assumed to be where the parallel of $39^{\circ}$ north latitude intersects the meridian of $86^{\circ}$ west longitude, which lines were taken as the axes of moments.

The product of the population of a given area by its distance from the assumed parallel is called a north or south moment, and the product of the population of the area by its distance from the assumed meridian is called an east or west moment. In calculating north and south moments the distances are measured in minutes of are; in calculating east and west moments it is necessary to use miles on account of the unequal length of the degrees and minutes in different latitudes. The population of the country is grouped by square degrees-that is, by areas included between consecutive parallels and meridians-as they are con-
venient units with which to work. The population of the principal cities is then deducted from that of the respective square degrees in which they lie and treated separately. The center of population of each square degree is assumed to be at its geographical center except where such an assumption is manifestly incorrect; in these cases the position of the center of population of the square degree is estimated as nearly as possible. The population of each square degree north and south of the assumed parallel is multiplied by the distance of its center from that parallel; a similar calculation is made for the principal cities; and the sum of the north moments and the sum of the south moments are ascertained. The difference between these two sums, divided by the total population of the country, gives a correction to the latitude. In a similar manner the sums of the east and of the west moments are ascertained and from them the correction in longitude is made.

At the Fourteenth Census the center of population was in the following position:

This point is in southwestern Indiana, 1.9 miles west of Whitehall, Clay township, and 8.3 miles south-southeast of Spencer, Washington township, Owen County, Ind., shown on map on Plate 120.

During the last decade, 1910 to 1920 , the center of population moved west $10^{\prime} 55^{\prime \prime}$, approximately 9.8 miles, the smallest movement the center has ever shown, and about one-fourth of its westward movement from 1900 to 1910 , while its northward movement was only $9^{\prime \prime}$, or approximately two-tenths of a mile. The great increase in the population of New York, Pennsylvania, and certain other states north of the thirty-ninth parallel has balanced the increase in Texas, Oklahoma, and southern California. The advance toward the West is, to a large extent, due to the increase in the population of the Pacific Coast states, their distance from the center giving any increase of population in those states much greater weight than an equal increase in the populous states east, which are nearer the center. The cities of Seattle, San Francisco, and Los Angeles, with a combined population of $1,398,661$, exert a greater influence on the center of population than the cities of Baltimore, Boston, Buffalo, Cleveland, Philadelphia, and Pittsburgh, with a combined population of 5,197,624.

The westward movement from 1910 to 1920 was due principally to the increase of orer $1,000,000$ in the population of the state of California, which had a greater growth than at the previous decade, from 1900 to 1910 . In this connection it would be well to call attention to the fact that individuals in the states on the Pacific coast exert an influence on the center of
population proportional to their distance from the center.

There has been slight change in the northern movement of the center of population since 1900 , as from 1900 to 1910 the northern movement was 0.7 of a mile and from 1910 to 1920 a little less than 0.2 of a mile, showing that the weight of the population of the United States north and south of the thirty-ninth parallel was nearly equal.

The result of the computations in 1920 for the location of the median point shows that it had moved east 8.8 miles, while, during the same decade, the center of population had a western movement of 9.8 miles. The movement in opposite directions of the two points shows in a striking manner the difference in the character of the methods used for their location. There was very slight difference in the northern movement of the two points, the median point having made practically no change since 1910 (0.019 of a mile), and the center of population moving only 0.2 of a mile.
LOCATION OF THE CENTER OF POPULATION AT PRIOR CENSUSES.
In 1790 the center of population was at $39^{\circ} 16^{\prime} 30^{\prime \prime}$ north latitude and $76^{\circ} 11^{\prime} 12^{\prime \prime}$ west longitude, which, according to the best maps, is a point in Maryland about 23 miles east of Baltimore. During the decade from 1790 to 1800 it moved almost due west to a point about 18 miles west of the same city, latitude $39^{\circ} 16^{\prime} 6^{\prime \prime}$, longitude $76^{\circ} 56^{\prime} 30^{\prime \prime}$.

From 1800 to 1810 it moved west and slightly south to a point in the state of Virginia about 40 miles northivest by west of Washington, D. C., latitude $39^{\circ} 11^{\prime} 30^{\prime \prime}$, longitude $77^{\circ} 37^{\prime} 12^{\prime \prime}$. The southward movement during this decade was due to the annexation of the territory of Louisiana, which contained quite extensive settlements.

From 1810 to 1820 the center of population moved west and again slightly south to a point in what is now West Virginia, about 16 miles east of Moorefield, latitude $39^{\circ} 5^{\prime} 42^{\prime \prime}$, longitude $78^{\circ} 33^{\prime}$. This second southward movement was due principally to the extension of settlements in Mississippi, Alabama, and eastern Georgia.

From 1820 to 1830 it again moved west and south to a point about 19 miles west-southwest of Moorefield, in the area now comprising the state of West Virginia, latitude $38^{\circ} 57^{\prime} 54^{\prime \prime}$, longitude $79^{\circ} 16^{\prime} 54^{\prime \prime}$. This is the most decided southward movement that it has made during any decade, owing to the annexation of Florida and the great extension of settlements in Alabama, Louisiana, Mississippi, and Arkansas, or generally, it may be said, in the Southwest. The movement from 1870 to 1880 was apparently greater, but this was due chiefly to a defective enumeration in 1870, and can not be considered as an actual change in the distribution of population.

From 1830 to 1840 it continued west, but slightly changed its course to the north, reaching a point 16 miles south of Clarksburg, in the area now comprising the state of West Virginia, latitude $39^{\circ} 2^{\prime}$, longitude $80^{\circ} 18^{\prime}$. During this decade population had increased rapidly in the Prairie states and in the southern portions of Michigan and Wisconsin.

From 1840 to 1850 the center moved west and slightly south again, reaching a point about 23 miles southeast of Parkersburg, in the area now comprising the state of West Virginia, latitude $38^{\circ} 59^{\prime}$, kongitude $81^{\circ} 19^{\prime}$, the change of direction to the south being largely due to the annexation of Texas.

From 1850 to 1860 it moved west and slightly north, reaching a point 20 miles south by east of Chillicothe, Ohio, latitude $39^{\circ} 0^{\prime} 24^{\prime \prime}$, longitude $82^{\circ} 48^{\prime} 48^{\prime \prime}$.

From 1860 to 1870 it moved west and sharply north. reaching a point about 48 miles east by north of Cincinnati, Ohio, in latitude $39^{\circ} 12^{\prime}$, longitude $83^{\circ} 35^{\prime} 42^{\prime \prime}$. This northward movement was due in part to the waste and destruction in the South, consequent upon the Civil War, and in part to the fact that the census of 1870 was defective in its enumeration of the southern people, especially of the newly enfranchised Negro population.

In 1850 the center of population had returned south to nearly the latitude occupied in 1860 , being in Kentucky, just south of the Ohio River, in latitude $39^{\circ} 4^{\prime} 8^{\prime \prime}$, longitude $84^{\circ} 39^{\prime} 40^{\prime \prime}$, 8 miles west by south of Cincimnati, Ohio.

In 1890 , owing to the great increase of population in the cities of the Northwest and in the state of Washington, also in New England, the center moved north
to latitude $39^{\circ} 11^{\prime} 56^{\prime \prime}$, longitude $85^{\circ} 32^{\prime} 53^{\prime \prime}$, to a point 20 miles east of Columbus, Ind.

During the decade from 1890 to 1900 the center of population moved west $16^{\prime} 1^{\prime \prime}$, or 14.6 miles, to longitude $85^{\circ} 48^{\prime} 54^{\prime \prime}$, and south $2^{\prime} 20^{\prime \prime}$, or 2.8 miles, to latitude $39^{\circ} 9^{\prime} 30^{\prime \prime}$, to a point 6 miles southeast of Columbus, Ind. The great increase in the population of Indian Territory, Ollahoma, and Texas was largely offset by an increase in the population of the North Atlantic states.

In 1910 the center of population was at the point where the parallel of latitude of $39^{\circ} 10^{\prime} 12^{\prime \prime} \mathrm{N}$. intersects the meridian of longitude of $56^{\circ} 32^{\prime} 20^{\prime \prime} \mathrm{W}$. and for the first time in its history was located in a city, the city of Bloomington, Ind. From 1900 to 1910 it moved 0.7 of a mile north and 38.9 miles west, the westward movement being nearly three times as great as from 1890 to 1900 , but was less than the westward movement for all previous decades, except between 1800 and 1810.
The closeness with which the center of population throughout its westward movement has clung to the thirty-ninth parallel of latitude is remarkable. The point farthest north was reached in 1790 and the farthest south in 1830, but the difference was only 21.4 miles. The greatest movement west was during the decade from 1850 to 1860 , when the center adranced 80.6 miles; the least movement west was during the last decade, from 1910 to 1920, when it advanced 9.8 miles. The total westward movement from 1790 to 1920 was 567 miles. Talle 6 and the map on Plate 121 show the location of the center of population and its advance during each decade since 1790 .

Table 6.-POSITION OF TIIE CENTER OF POPULATION: 1790 TO 1920.

[^2]
## MEDIAN LINES.

In comnection with the definition of the median point another method of presenting facts with regard to the geographical distribution of the population has been noted, involving the location of median lines. A parallel of latitude is determined which evenly divides the population so that the population north of that parallel is equal to that south. Similarly, a meridian of longitude is determined which divides the population evenly east and west of the tine. In calculating these median lines it is necessary, in the case of the square degrees of latitude and longitude which are traversed by the lines themselves, to assume that the population is evenly distributed through these square degrees or to make an estimated adjustment where this is obviously not the case.

The eastern terminus of the median parallel, according to the census of 1920, is on the New Jersey coast near Seagirt. In its course west this line passes through central New Jersey, leaving the state near Burlington and entering Pemnsylvania a few miles north of Philadelphia, thence
passing through Norristown and continuing through southern Pennsylvania and across the northern extremity of West Virginia, leaving the latter state at a point a few miles north of Wheeling. It nearly bisects Ohio, Indiana, and Illinois, crossing about 10 miles north of Columbus, Ohio, 25 miles north of Indianapolis, Ind., and about 20 miles north of Springfield, Ill. Through Missouri it runs about 30 miles south of the Iowa and Missouri line, thence passing through Nebraska about 10 miles north of its southern boundary, and across the northern part of Colorado, passing about 5 miles north of Boulder city. Its location in Utah is about 45 miles south of Salt Lake City, near Spanish Fork city. There are no large towns near its course across the northern part of Nevada. In California it passes 5 miles south of Red Bluff city, Tehama County. The western terminus of the median parallel is on the Pacific coast, in Humboldt County, Calif., about 5 miles north of Point Delgada and 25 miles south of Cape Mendocino, the point of continental United States extending farthest west.

Table 7.-median lines: 1880 TO 1920.

| CENSUS YEAR. | Median parallel, north latitude. |  |  | Median meridian. west longitude. |  |  | MOVEMENT IN MILES <br> DURING PRECEDING DECADE. |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Median | Median | Median |
|  | - | , | ' |  |  |  | - | , | " |  |  |  |
| 1880 |  | 57 |  | 84 | 7 | 12 |  |  |  |
| 1890. |  | 2 |  |  | 40 | 1 | 6.6 | 27.0 |  |
| 1900. | 40 | 4 |  |  | 51 | 29 | 2.4 | 10.8 |  |
| 1910. | 40 | 6 |  |  | 59 | 59 | 2.3 | 7.5 |  |
| 1920. |  | 6 |  |  | 49 |  | 0.019 |  | 8. 8 |

In locating the median meridian, it was found that it had moved 8.8 miles east since 1910, and its northern end was located 8 miles east of Whitefish Point in the northern peninsula of Michigan; from that point it passes south through the southern peninsula of Michigan, about 10 miles west of Lansing, approximately 1 mile west of the eastern boundary of Indiana, and crosses the Ohio River about 15 miles west of Cincimati, Ohio, thence through the central part of Kentucky, passing through Frankfort. After crossing eastern Tennessee, it enters Georgia about 20 miles east of Chattanooga. It then crosses the western part of Georgia about 5 miles east of Columbus and leaves this state and enters Florida where the FloridaGeorgia boundary line crosses the Apalachicola River and ends in the Gulf of Mexico, 8 miles east of Apalachicola.

During the three decades from 1880 to 1910, there was little change in the position of the median parallel, the changes being so slight they could not be indicated
on a small map. During the decade from 1910 to 1920, the median parallel was practically in the same location, but the median meridian moved east 8.8 miles. This was due entirely to the great increase in population of the states on the Atlantic slope.

The greatest change is noted for the decade from 1880 to 1890 , during which period the median parallel moved north 6.6 miles, and the median meridian west 27 miles. The latitude and longitude of these lines at the several censuses, from 1880 to 1920, are shown in Table 7, and their location in 1920 is shown on the map on Plate No. 122.

Although the median line exactly bisects the population as a whole it does not necessarily bisect the population of the eastern or western parts of the country. The median parallel does not bisect even approximately the population residing east or west of the Mississippi River. The intersecting median lines divide the country into four parts, but in neither of these parts is there exactly one-fourth of the total
population. The diagonally opposite sections, however, are necessarily equal in population; ${ }^{1}$ that is, the northeastern section exactly equals in population the southwestern and, similarly, the population of the southeastern section exactly equals the population of the northwestern; in other words, the northeastern and southwestern quarters each contain a population of approximately $31,450,000$, while the southeastern and northwestern sections each contain about 21,400,000.

## MEDIAN POINT.

The movement of the center of population in 1920 , as compared with the movement of the median point, shows that the computations are made on an entirely different basis and the results are really not comparable. In other words, the median point and the center of population are affected differently by the movement of population. From 1910 to 1920 the center of population moved west 9.8 miles, while the median point moved east 8.8 miles. The effect of the increase in population of $1,000,000$ persons in California was much less on the median point than it was on the center of population, due to the fact that the distance of the individual from the median point does not affect it. It will also be noted that both the center of population and the median point had a very slight northern movement, being located on parallets of latitude less than a degree apart.

What is termed by the Census Bureau the "median point" of the population corresponds, as already stated, to a common conception of the center of population; that is, it is the junction of the median line dividing the population equally north and south with the median line dividing it equally east and west, distance of the population from the center not being considered. As already indicated, the changes in the median point reflect only the difference between the growth of population east of the point and the growth west of it and the difference between the growth north and south of the point; other differences in relative growth do not affect its location.

In 1920 the median point was located at latitude $40^{\circ} 6^{\prime} 25^{\prime \prime}$ north and longitude $84^{\circ} 49^{\prime} 59^{\prime \prime}$ west, near the eighty-fifth meridian. Its location, therefore, was 6 miles slightly west of south of Union City, Randolph County, Ind.; its eastward movement during the decade was 8.8 miles and its northward movement 0.019 of a mile. Comparing its movement since 1910 with that of the center of population, it will be noted that the north movement of the center of population

[^3]was 0.18 of a mile more than that of the median point; the center of population moved west 9.8 miles, while the median point moved east 8.8 miles, showing that the increase in the population of the Pacific coast had a much greater influence on the movement of the center of population than upon the median point.

It will be noted that the location of the median point was 121 miles northeast of the center of population in 1920, showing the divergence of the methods of finding the two points (the center of population and the median point).

The exact location of the median point is indicated by the median lines already shown; in Talle 8 its approximate location with reference to certain towns is described.

Table 8.-Position of the Median Point: 1880 to 1920.

| census tear. | Approximate location by important towns. |
| :---: | :---: |
| 1580. | 16 miles nearly due west of Springtield, Ohio. |
| 1890. | 5 miles southwest of Greenville, Ohio. |
| 1900. | In Spartanburg, Ind. |
| 1910 | 3 miles south of Winchester, Ind. |
| 1920 | 6 miles slightly west of south of Union City, Ind. |

## CENTERS OF POPULATION OF STATES.

The center of the population of each of the states is shown on Plates 123 to 136, inclusive, and the location of each of the points, from 1880 to 1920, is shown in Table 9 on pages 13 to 16.
There have been so many requests as to the location of the centers of population of the various states that the computations were first made in 1910 for the censuses beginning with the census of 1880 , and they have been again computed for 1920 .

The direction of the movement of the center in each state during the last 40 years is a matter of interest, showing as it does the direction in which the population has grown and, to a certain extent, the direction in which the state has developed.

From 1900 to 1920 the center of population of the United States, exclusive of its outlying possessions, moved west and north. A comparison of the movements of the centers of population of the states, including the District of Columbia, during the decade from 1910 to 1920 brings out the fact that the centers of 23 states moved north, while for 26 states the movement was south; the centers of population of 26 of the states moved east and of 23 moved west. The movement of the center of population of each state does not, therefore, coincide with the movement of the center of population of the entire United States.

As an analysis of the movement of the center of population for each state was deemed impracticable, only a brief description is given of the movement for a few of the states in which the rariation of the movement of the center presents some exceptional features. The center of population of California from 1880 to

1890, advanced 34.9 miles south and 23.1 miles east, an actual distance of 41.9 miles; this was the greatest advance made during that decade in any state. From 1890 to 1900 Oklahoma held this distinction, when the movement of the center was 30.7 miles, the north movement 13.2 miles and the west movement 27.7 miles. The greatest movement from 1900 to 1910 was made in North Dakota, the distance the center moved being 44.7 miles, made up of a south movement of 1.3 miles and a west movement of 44.7 miles. The greatest distance any center moved from 1910 to 1920 was in the state of Montana. It moved 38.3 miles northeast by east to a point 9.7 miles southwest of Utica, Judith Basin County.
The greatest distance the center of population of any state advanced during the 40 years from 1880 to 1920 was in California. The center moved in a southeasterly direction 130 miles, the point in 1880 being located 3.3 miles east by south of Moorland, San Joaquin County, and in 1920, 36.2 miles south-southwest of Fresno, Fresno County.
It is well, also, to note those states in which the least change occurred in the location of the center. The center of population of Massachusetts from 1880 to 1890 advanced one-tenth of a mile east; there was no north nor south movement; from 1890 to 1900 there was a south movement of two-tenths of a mile, and a movement east of 158 feet. From 1900 to 1910 it had an eastern movement of 2.6 miles and one-tenth of a mile north, while from 1910 to 1920 it moved five-tenths of a mile south-southwest.

In Delaware, from 1900 to 1910, the movement was three-tenths of a mile north and four-tenths of a mile west; from 1910 to 1920 the movement was accelerated when the center moved 15.6 miles north by east, the greatest movement that the center has ever made in this state.

The smallest change in the location of the center made during the period from 1880 to 1920 was in Rhode Island; its center of population during the 40 years moved 1.7 miles directly north. The center of population of this state in 1880 was located 4.1 miles southwest by south of Providence and in 1920 it was 2.3 miles southwest of the same city.

The center of population of New York state in 1880 was 3 miles northwest by west of Craigeclare, Sullivan County, and in 1920 it was 3.8 miles south by west of Forestine, in the same county. The distance traversed was 6.5 miles from 1880 to $1890 ; 9.5$ miles from 1890 to $1900 ; 11$ miles from 1900 to 1910 ; and 3.9 miles from 1910 to 1920. The movement was south and east from 1880 to 1920 , except from 1900 to 1910, when the movement was south and west.

Although Texas has the greatest area of any state, the movements of the center were not large, as the development in all parts of the state has been nearly uniform. The center in 1880 was located 6.4 miles
southwest of Thornton, Limestone County; in the 40 years to 1920 , it had shifted to 12.1 miles southwest of Waco, McLennan County. The northwestern movement from 1880 to 1890 was 13.7 miles; from 1890 to $1900,3.2$ miles; from 1900 to 1910, 22.6 miles; while from 1910 to 1920 it was 5 miles southwest.
The states which show the greatest variation in the location of the center are Arizona, Kansas, Nevada, and New Jersey. For Arizona the movement shown in 1890 was 2 miles south and one-tenth of a mile west; from 1890 to 1900 it reversed the direction to 21.2 miles north and 9.3 miles east, an actual distance of 23.2 miles. During the decade from 1900 to 1910 it moved 11.5 miles south and 15.7 miles east, and from 1910 to 1920 it moved almost directly west 13.3 miles. For Kansas, while the movement was south at each census, from 1880 to 1890 it advanced westward 24.3 miles; from 1890 to $1900,22.3$ miles east; while from 1900 to 1910 the direction again changed to the west, 5.7 miles; from 1910 to 1920 the western movement was only four-tenths of a mile, a net movement during the 40 years of 9.9 miles south and 8.1 miles west. From 1880 to 1890 the movement in Nevada was south 11.2 miles and west 2.1 miles; from 1890 to 1900 it changed, moving north 22.6 miles and east 11 miles. The development of the mines between 1900 and 1910 in the southeastern portion of the state again changed the direction and produced the greatest advance at any decade, the movenent being 40 miles south and 14.2 miles east, an actual distance of 42.4 miles; from 1910 to 1920 it moved 4.8 miles north-northeast, the smallest change it had ever made. During the 40 years from 1880 to 1920 the net movement was 24.1 miles south and 25 miles east. New Jersey has also shown considerable change in the direction of the movement of its center of population. From 1880 to 1890 it was 13.2 miles north and seven-tenths of a mile east; in the next decade, from 1890 to 1900 , the movement was 10.8 miles south and five-tenths of a mile east; from 1900 to 1910 it again moved north 1.7 miles and east 2.9 miles, and from 1910 to 1920 the movement was southeast, 2 miles.
The movement of the center of population of the states of Maine, Massachusetts, and Oklahoma varied in direction at each decade more than any of the other states, the movement in each state being reversed at each census.

Connecticut shows very small but steady movements south and west, the distance from 1880 to 1890 being 1.9 miles; from 1890 to 1900,1 mile; from 1900 to 1910, 1.3 miles; and from 1910 to 1920, 1.6 miles.

In Illinois the effect of the growth of Chicago on the center of population is evident from its northeast movement at each census, the actual distance from 1880 to 1890 being 18.4 miles; from 1890 to $1900,10.8$ miles; from 1900 to 1910, 6.4 miles; and from 1910 to 1920, 7.1 miles northeast.

There were only seven states in which the center of population moved in the same general direction at each census from 1880 to 1920. These states are as follows: In the state of Illinois it moved north and east; for California and Georgia the movement was south and east; for Connecticut, North Carolina, and West Virginia the movement was south and west; and for Maryland the movement was north and west.

A comparison of Plates Nos. 123 to 136, on which are located the centers of population of the states, will bring to our attention the fact that in only nine
states are the centers of population near the state capitals. The nine states are Arkansas, Delaware, Indiana, Missouri, Montana, New Hampshire, Rhode Island, South Carolina, and Vermont. As the center of population is the point from which all the population is supposed to be equidistant, if it were necessary to assemble all the inhabitants of a state at one place, each individual to travel in a direct line from his residence to the meeting place, the center of population is the point they could all reach with the minimum aggregate of travel.

Table 9.-CENTERS OF POPULATION OF EACH STATE: 1880 TO 1920.

| State. | Census year. | North latitude. | West longitude. | approximate location by important towns. |  | Movement in miles during preceding decade. |  |  |  |  |

## CENTER OF AREA

In eonnection with the location of the center of population of the United States, it is of interest to note also the position of what may be termed the center of area-that is, the point on which the surface of eontinental United States would balanee, if it were a plane of uniform weight per unit of area. This point is loeated in northern Kansas, 10 miles north of Smith Center, the eounty seat of Smith County, approximate latitude $39^{\circ} 55^{\prime}$, longitude $95^{\circ} 50^{\prime}$, and is, therefore, $44^{\prime} 39^{\prime \prime}$ ( 51.3 miles) north and $12^{\circ} 66^{\prime} 45^{\prime \prime}$ ( 647.4 miles) west of the eenter of population. Its location is shown on Plate No. 122 designating the position of the median lines. This would be the eenter of population, if the population were distributed evenly over the territory of continental United States.

The Geological Survey, Department of the Interior, has determined the center of area of each state as given in Tahle 10 and as shown on the map on Plate No. 138.

## CENTER OF FOREIGN-BORN POPULATION.

The movement of the center of the total population from eensus to eensus is the result of all migration, both interstate and foreigh. In view of the change in the eharacter of the foreign immigration and the large proportion of immigrants who are settling in the eities, the location of the eenter of foreignborn population and its movement from decade to deeade is a matter of great interest.
On the map on Plate No. 121 the center of total population at each eensus from 1790 to 1920 is indicated, also the location of the eenter of the foreignborn population from 1880 to 1920. The location of the eenter of population and the median point were diseussed on pages 7 to 13 . At the eensus of 1910, the eenter of the foreign-born population was computed from 1880 to 1910 , the eenter of this elass of the population not having been worked at a previous census.

In 1880 the center of the foreign-born population was located in Monroe County, Mich.. in latitude $41^{\circ}$ $49^{\prime} 52^{\prime \prime}$, longitude $83^{\circ} 44^{\prime} 17^{\prime \prime}$, approximately 15.5 miles northwest of Toledo, Ohio.

In 1890 the eenter had advanced almost $2^{\circ}$ to the west. The opening of Oklahoma and the inerease in the population of Texas drew the point to the south, when it was loeated in latitude $41^{\circ} 22^{\prime} 5^{\prime \prime}$, longitude $85^{\circ} 23^{\prime} 17^{\prime \prime}$, in Noble County, Ind., approximately 54.5 miles southeast of South Bend.

The falling off in the class of immigrants who settled in the far Western states is indieated by the ehange in the direction of the movement from 1890 to 1900 , for in 1900 the eenter of the foreign-born population was loeated in Defiance County, Ohio, is miles northwest of Defiance, being in latitude $41^{\circ} 22^{\prime} 48^{\prime \prime}$, ahmost the same latitude as in 1890 , and longitude $S 4^{\circ} 43^{\prime} 21^{\prime \prime}$, nearly a degree farther east. The eastern movement was due, as previously stated, to the newer immigration that settled prineipally in the large eities of the East.

In 1910 the center of foreign-born population was again located in Defiance County, Ohio, about 10.5 miles west of Defiance, in latitude $41^{\circ} 17^{\prime} 24^{\prime \prime}$, showing a deeided movement south, and in longitude $84^{\circ} 36^{\prime} 7^{\prime \prime}$, showing a further advance toward the east, but not nearly as great as during the previous deeade. This was undoubtedly due to the great increase in the foreign-born population of California, which, on account of its great distance from the eenter, has a mueh greater weight than an equal number of foreign-born in the Eastern and Middle states.

In 1920 the eenter of foreign-born population was located in latitude $41^{\circ} 3^{\prime} 45^{\prime \prime}$, longitude $S 4^{\circ} 49^{\prime} 17^{\prime \prime}$, in the eastern part of Allen County, Ind.., about
10.8 miles east of New Haven and 16 miles east of Fort Wayne. For the first time in three deeades the eenter of foreign-borm population showed a western movement. From 1890 to 1900 it moved 35.6 miles in a northeasterly direction, and from 1900 to 1910, 8.2 miles in a southeasterly direction. At the latter censuses the eenter was located in Defiance County, Ohio, but in 1920 it moved just aeross the state boundary line into Allen County, Ind. The center in 1880 was located in Monroe County, Mieh., and in 1890 in Noble County, Ind., so that in 30 years the center has returned to the state in which it was located in 1890.

The ehange in direetion of the movement of this center from east to west is due principally to the increase in foreign-born white population in the state
of California. The total increase in the forcign-born white population of the United States was 367,209 and the inerease in the statcs of Texas, California, and Arizona was 316,222 , or 86 per cent of the total inerease. Of the 20 states showing an increase in this element of their population from 1910 to 1920,12 were loeated east of the meridian on which the center was loeated in 1920 , and 7 were west, while 1 state, Michigan, is divided by the meridian. The states west of the meridian, however, had mueh greater inereases in their foreign-born white population than the states east; the largest increases were in California, Miehigan, and Texas.

The following table gives the center of foreign-born population at each census, and its movement in miles, also the location in relation to a city:

Table 11.—(ENTER OF FOREIGN-BORN POPULATION: $1880^{\text {TO }}$ TO 1920.

## CENTER OF NEGRO POPULATION.

The question of negro migration has always been one of great interest and, on the map on Plate 121, the location of the center of negro population of continental United States is indieated. The center of negro population was eomputed for 1790 and for eaeh eensus from 1880 to 1920 , no computations being made for the censuses from 1800 to 1870 , inclusive. The movement of the center of negro population is an aeeurate index of the direction of negro migration. In 1790 the center of negro population was loeated in Dinwiddie County, Ya., 25 miles west-southwest of Petersburg, in latitude $37^{\circ} 4^{\prime} 8^{\prime \prime}$ north, and longitude $77^{\circ} 51^{\prime} 21^{\prime \prime}$ west. In 1880 the center was located in northwestern Georgia, 10.4 miles east of Lafayette, in the eastern part of Walker County, latitude $34^{\circ} 42^{\prime} 14^{\prime \prime}$ north, longitude $85^{\circ} 6^{\prime} 56^{\prime \prime}$ west. From 1880 to 1890 the southwesterly movement of the center was eontinued, and it advaneed 20.1 miles, to a point in Walker County, Ga., 10.5 miles southwest of Lafayette, latitude $34^{\circ} 36^{\prime} 18^{\prime \prime}$ north, longitude $85^{\circ} 26^{\prime} 49^{\prime \prime}$ west, about 4 miles east of the Alabama line. In 100 years it had moved southwest 463 miles, an average of 46 miles for each decade. From 1890 to 1900 its movement was greatly retarded, and it adraneed only
9.1 miles southwest, aeross the Alabama-Georgia state line into Dekalb County, Ala., 10.7 mikes northeast of Fort Payne, in northeastern Alabama, about 4 miles west of the Georgia line, latitude $34^{\circ} 31^{\prime} 16^{\prime \prime}$ north, longitude $85^{\circ} 34^{\prime} 35^{\prime \prime}$ west. In 1910 the eenter of negro population was loeated 5.4 miles northnortheast of Fort Payne, Dekalb County, Ala., in latitude $34^{\circ} 30^{\prime} 0^{\prime \prime}$ north, and longitude $85^{\circ} 40^{\prime} 43^{\prime \prime}$ west, its movement for the decade being 6.0 miles west-southwest. Its movement south was evidently greatly retarded by the migration of the negroes to the Northern and Eastern states. A study of the movement from 1790 to 1910 shows a steady advance in a southwesterly direction, but the distance covered at eaeh decade is much smaller than the movement at the previous deeade. In 1920 it moved baek aeross the state line into Georgia and was loeated in latitude $34^{\circ} 46^{\prime} 52^{\prime \prime}$, and longitude $85^{\circ} 30^{\prime} 48^{\prime \prime}$, the eastern movement being $9^{\prime} 55^{\prime \prime}$, or approximately 9.4 miles, and the northern movement being $16^{\prime} 52^{\prime \prime}$, or 19.4 miles. Its loeation was approximately 1.8 miles north-northeast of Rising Fawn town, Dade County, Ga. For the first time in the history of the country, the center of negro population has moved northeast, its former movements having been in a southwesterly direction; this northeasterly movement was due prin-
cipally to the great increase in the negro population of Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, West Virginia, Ohio, Indiana, and Michigan. The total increase in the negro population of the United States was 635,368 , and it will be noted that the increase in the Northern states mentioned was 56 per cent of the total increase. This hegira north of the negro population was due mainly to the expansion of certain industries during the World War,
the high wages paid being the great attraction. It is probably true that this movement has been continued, due to the reduction of the cotton crop and the demand for common labor at higher wages in the North.

In the following table is given the latitude and longitude of the center of negro population at each census, also the distance moved during the decade, and the location of the center relative to a city or town:

Table 12.-CENTER of Negro population: 1790 AND 1880 TO 1920.

1 Movement from 1790 to 1880 .

CENTERS OF URBAN AND RURAL POPULATION.
On Plate 121, in addition to centers's of total and foreign-born population, are indicated the locations of the centers of urban and rural population in 1910 and 1920. As the centers of urban and rural population were not computed for previous censuses, no statement can be made as to the distance or direction in which these centers moved from 1900 to 1910 or during any previous decade. In 1910 not only was the center of urban population located, but the center of rural population was also ascertained-that is, the population excluding all places with 2,500 or more inhabitants in 1910, as well as the New England towns of that size. The center of urban population was located in 1910 in latitude $40^{\circ} 16^{\prime} 12^{\prime \prime}$ and longitude $83^{\circ} 59^{\prime} 22^{\prime \prime}$, in Champaign County, Ohio, 15.3 miles northeast of Piqua, Miami County, Ohio. In 1920 the center of urban population was located in latitude $40^{\circ} 5^{\prime} 7^{\prime \prime}$ and longitude $84^{\circ} 40^{\prime} 53^{\prime \prime}$, in Darke County, Ohio, 2.8 miles west-southwest of Greenville city.

In 1910 the center of rural population was located in latitude $38^{\circ} 12^{\prime} 36^{\prime \prime}$ and longitude $88^{\circ} 39^{\prime} 3^{\prime \prime}$, in Hamilton County, Ill., 16.7 miles southeast of Mount Vernon, Jefferson County, Ill. In 1920 the center of rural population was located in latitude $38^{\circ} 12^{\prime} 31^{\prime \prime}$
and longitude $88^{\circ} 49^{\prime} 22^{\prime \prime}$, in Jefferson County, Ill., 8.5 miles southeast of Mount Vernon.

The location of these centers shows strikingly the preponderance of urban population in the northeastern portion of the United States, the center of urban population in 1920 being approximately 129.5 miles north and 225.4 miles east of the center of rural population. In a direct line the center of urban population was 260 miles northeast from the center of rural population.

From 1910 to 1920 the center of urban population moved 12.7 miles south and 36.7 miles west. During the same period the center of rural population moved 0.1 of a mile south and 9.4 miles west. The greater westward movement of the center of urban population is surprising, but it is probably due to the decrease in the number of immigrants, who usually settle in the eastern cities. The movement of the center of rural population west is significant as it is due to a decrease in the rural population of the east and a fair increase in the west. The increase in the rural population of the Mountain, Pacific, and West South Central divisions was the principal fact or in the west ward movement.

The latitude and longitude of these centers at each census, also the distance moved during the decade, and the location of the center relative to a city or town, are given in Tables 13 and 14.

## CENTERS OF AGRICULTURE.

The map on Plate 137 shows the location of center of population from 1790 to 1920 , and the centers of the number of farms, total area in farms, improved acreage, farm values, agricultural products, and manufactures, from 1850 to 1920 , and may be designated as a chart of the progress of the Nation, rcpresenting, as it does, the westward movement of population, agriculture, and manufactures.

## CENTER OF NUMBER OF FARMS.

The center of the number of farms in 1850 was located on the Ohio River, between Ohio and the present state of West Virginia, at nearly the same point as the center of corn production. From this position the center of the number of farms moved 116.8 miles in a northwesterly direction, and in 1860 reached a point 13 miles southeast of Xenia, Ohio. From 1860 to 1870 the center advanced 20.8 miles almost directly south to a position in Brown County, 31 miles east-northeast of Cincinnati, Ohio. From 1870 to 1880 the distance covered was 36.7 miles in a southwesterly direction across the Ohio River into Kentucky to a point 20 miles south by east of Newport. From 1880 to 1890 its progress of 100.1 miles was nearly due west into Indiana. From 1890 to 1900 it moved in a southwesterly direction 109.4 miles to a point 10 miles southeast of Fairfield, Wayne County, Ill. From 1900 to 1910 the center moved west-southwest 43.2 miles to a point 6.6 miles north-northwest of Benton, Franklin County, Ill. From 1910 to 1920 the southwestern movement was continued and the center advanced 25.9 miles and was located 4.2 miles southwest of Pinckneyville, Perry County, Ill.

## CENTER OF TOTAL FARM AREA.

The center of the number of acres of farm land, or total area in farms, in 1850 was located in Owsley County, Ky., the farthest south of any center shown on the map except the center of cotton production. From 1850 to 1870 it moved to a point 55 miles east by north of Evansville, Ind. From 1870 to 1880 it advanced in a westerly direction to a position 7.3 miles northcast of Carmi, Ill. From 1880 to 1890 it moved northwest across the state of Illinois to a point 6 miles north by west of Alton, Ill., its next movement being southwest to a location about 48 miles southwest of Jcfferson City, Mo. The center of total farm area has not been computed since 1900 .

## CENTER OF IMPROVED ACREAGE.

The center of improved acreage was first computed in 1900 when it was locatcd in Pike County, Ill., 14 miles southeast by south of Pittsfield, in Pike County, Ill. From 1900 to 1910 it moved 65.1 miles, almost directly west to a point 9.2 miles east-northeast of Paris, Monroe County, Mo. From 1910 to 1920 its movement was northwest 47.8 miles to a point 3.8 miles south-southwest of New Cambria, Macon County, Mo.

## CENTER OF VALUE OF FARM PROPERTY.

The center of the value of farm property, which in 1850 was located 13 miles northwest of Clarksburg, in the present state of West Virginia, in 1860 had advanced south and west to a point 14 miles northwest of Portsmouth, Ohio. From 1860 to 1870 its movement was northwcst to a position 13 miles northwest of Urbana, Ohio. From 1870 to 1900 it moved west
in a straight line across Indiana and Illinois to a point in Cass County, 16 miles north-northwest of Jacksonville, Morgan County, Ill. Its greatest westward movement, and the greatest advance made for any decade, approximately 175 miles, was from 1880 to 1890 .

The center of value of farm property advanced, from 1900 to 1910, 103.6 miles directly west and was located 14 miles south-southwest of Edina, Knox County, Mo. This is not as great an adrance as from 1880 to 1890 , nor from 1850 to 1860 , but is the third largest western advance it has made. From 1910 to 1920 it advanced 45.1 miles in a westerly direction to a point 3.6 miles northeast of Limneus, Limn County, Mo.

## CENTER OF PRODUCTION OF CEREALS.

The center of cereals, comprising corn, wheat, oats, barley, buckwheat, and rye, was first computed in 1900 when it was located 6 miles south of Warsaw, in Hancock County, III. From 1900 to 1910 it moved 28.6 miles north-northwest to a point 19.1 miles west of Fort Madison, in Lee County, Iowa. From 1910 to 1920 it moved 46.6 miles southwest to a point 4 miles south of Edina, in Knox County, Mo.

## CENTER OF CORN PRODUCTION.

The center of corn production has moved in a westerly direction, but more rapidly than the center of population, as from 1850 to 1860 it moved south of west 271.7 miles, the distance traversed being greater than the entire western movement of the center of population from 1850 to 1900 . Its movement from 1860 to 1870 and from 1870 to 1880 was almost directly northwest. From 1880 to 1890 it advanced south of west to a point 2 miles southwest of Carrollton, Ill. The movement from 1890 to 1900 was so slight that it could hardly be indicated on the map, being only $17^{\prime \prime}$ west and $2^{\prime} 36^{\prime \prime}$ north. The center of corn production was not computed in 1910, but
from 1900 to 1920 it moved almost directly east to a point 2.8 miles southeast of Hettick, Macoupin County, Ill.; the morement was only 24.9 miles.

## CENTER OF WHEAT PRODUCTION.

The center of wheat production has made a greater western and northern movement than any other center, as will be noted from its location in 1900. Its greatest southern adrance was made from 1880 to 1890, and its greatest northern movement from 1890 to 1900 . The center of wheat production was not computed in 1910, but from 1900 to 1920 it moved in a southwesterly direction 81.7 miles, to a point 3.2 miles east of IIamburg, Fremont County. Iowa.

## CENTER OF OATS PRODUCTION.

The other agricultural centers have moved in various erratic courses, but always in a general westerly direction, except the center of oats production, which from 1850 to 1860 moved north and cast. From 1860 to 1890 the center of oats production moved almost due west along the forty-first parallel of latitude. From 1890 to 1900 its course was northwest to a point 8 miles west of south of Tipton, Iowa. Its greatest movement was from 1860 to 1870, approximately 244 miles. As the center of oats production was not computed in 1910, the movement is given from 1900 to 1920. At the latter date it was located 3.7 miles north-northwest of Medrick, Keokuk County, Iowa, a movement of 69.8 miles. Since 1900 the general direction of the morement has been southwest.

The movements of the centers of the number of farms, value of farm property, area in farms, and of oats, corn, and wheat production, as indicated on the map, are widely divergent.

The latitude and longitude of these centers at each census, also the distance mored during the decade, and the location of the center relative to a city or town, are given in Table 15.

TAble 15.-POSITIONS OF TIIE CENTERS OF AGRI'LLTURE: 1850 TO 1920.

## CENTER OF COTTON PRODUCTION.

The location of the center of cotton production is indicated in Table 16 and on the map, Plate No. 137, for the years $1859,1879,1899,1906,1910,1914$, 1916, 191S, and 1919. The center in 1879 showed a movement almost directly north from that of 1859. From 1879 to 1906 the movement was in a southwesterly direction, but since 1906 the movement has been very irregular. In 1910 it moved northeast; in 1914 the movement was almost reversed and it moved directly south; from 1914 to 1916 it moved in a northwesterly direction; from 1916 to 1918 it moved directly east, to a point almost 20 miles west of its location in 1879; from 1918 to 1919 it again moved northwest about 75 miles, to a point 5.6 miles northeast of Greenwood, Leflore County, Miss., the highest northern latitude since 1859 , when it was located in the eastern part of Mississippi, near the Alabama line.

It will be noted that all of these centers are in the state of Mississippi, and have practically crossed the state from its eastern to its western boundary. It is undoubtedly due to the destruction caused by the boll weevil that the center of cotton in 1919 was located so much farther north than its location in 1859 or in any subsequent year.
Table 16.-Position of the Center of ('otton Production.

| census year. | Approximate location by important towns. |
| :---: | :---: |
| 18.99 | 13 miles southeast of Macon, in Noxubee County, Miss. |
| 1879 | 11 miles south of Columbus, in Lowndes County, Miss. |
| 1899. | 13 miles southeast of Lexington, in Holmes County, Miss. |
| 1906. | 5 miles northeast of Mayersville, in Issaquena County, Miss. |
| 1910. | 3 miles southwest of Vaiden, in Carroll County, Miss. |
| 1914. | 1 mile northwest of Sharpsburg, in Madison County, Miss. |
| 1916. | 16 miles southeast of Arcola, in Washington County, Miss. |
| 1918. | 6 miles southeast of Sturgis, in Oktibbeha County, Miss. |
| 1919. | 5.6 miles northeast of Greenwood, in Leflore County, Miss. |

## CENTER OF MANUFACTURES.

In order to ascertain the position of the center of manufactures at each census from 1850 to 1920 , except in 1910, as shown on page 24, the gross value of products was distributed by square degrees, and the remainder of the computations made as in computing the center of population. The center of manufactures, therefore, is really the center of the value of its gross products, and, as the value of products is representative of the industry, so the movement of the center of manufactures, during each decade, can be considered as the movement of the entire industry. On Plate 137 is a sketch map on which is indicated, by symbols, the location of the center of manufactures at each census from 1850 to 1900 and 1920, and
the center of population from 1790 to 1920 , bringing out clearly the steady westward movement of both manufactures and population.

The center of manufactures in 1850 was in Pennsylvania, 7.5 miles north by west of Mifflintown, and the center of population at the same census was located 23 miles southeast of Parkersburg, in the present state of West Virginia, 240 miles southwest of the center of manufactures. In 1860 the center of population had advanced 80.6 miles nearly due west, while the center of manufactures had moved in a westerly direction 100.2 miles. From 1860 to 1870 the center of population moved 44.1 miles north of west, while the center of manufactures moved slightly west of north 17.4 miles. From 1870 to 1880 the center of population moved south and west 58.1 miles, while the center of manufactures moved north and west 23.7 miles. From 1880 to 1890 the center of population moved slightly north of west 48.6 miles, while the center of manufactures moved south of west nearly twice that distance. From 1890 to 1900 the center of population mored alnost due west 14.6 miles, and the center of manufactures in a line almost parallel nearly 10 mites, or over twice the westward movement of the center of population. In general, the center of manufactures has followed the center of population in its westward movement, but not always along parallel lines, the greatest variations noted being from 1860 to 1870 and 1870 to 1880 . From 1850 to 1860, 1850 to 1890, and 1890 to 1900 , the center of manufactures made a greater western advance than the center of population.

The value of products of manufactures was not tabulated by counties at the census of 1910 , therefore, it was impossible to compute the center for that census. In 1920 the center of manufactures was located in latitude $40^{\circ} 28^{\prime} 13^{\prime \prime}$ and longitude $83^{\circ} 40^{\prime} 0^{\prime \prime}, 0.7$ of a mile north of Rushsylvania, Logan County, Ohio. The point was, therefore, located 71.9 miles west and 9.6 miles south of the center of manufactures in 1900 . As the center of population progressed but 48.6 miles west, from 1900 to 1920, and the center of manufactures 71.9 miles west, the center of manufactures made a greater western advance than the center of population, due principally to the great increase in the value of products of manufactures in the Pacific Coast states in 1920, as compared with 1900 . The movement of the center of manufactures from 1850 to 1920 was 329.2 miles, while the movement of the center of population during the same period was 290.2 miles, indicating that the movements of manufactures and population are closely related. In 1920 the latitude
of the center of manufactures was $1^{\circ} 17^{\prime} 52^{\prime \prime}$ north of the center of population, approximately 89.5 miles, and east $3^{\circ} 3^{\prime} 15^{\prime \prime}$, or 162.5 miles.

In order to show the relation between the total value of products and the number of wage earners the center of the number of wage earners was computed for the first time in 1920, and was located at latitude $40^{\circ} 22^{\prime} 48^{\prime \prime}$ and longitude $82^{\circ} 39^{\prime} 32^{\prime \prime}$, $1^{\circ} 0^{\prime} 28^{\prime \prime}$, or
53.2 miles east, and $5^{\prime} 25^{\prime \prime}$, or 6.2 miles, south of the center of the total value of proclucts.

The latitude and longitude of these centers, and the location of each center relative to a city or town, at each census, are given in Table 17, as well as the distance that the center of the value of products moved from census to census.

Table 17.-POSitions of the centers of manufactures: 1850 TO 1900 AND 1920.

DATE DUE
```

[^0]:    ${ }^{1}$ Does not include water surface of oceans, Gulf of Mexico, or Great Lakes, lying within jurisdiction of the C'pited States.

[^1]:    1 Net reduction of 114 square miles due to building of Pathfinder and Shoshone Reservoirs ( 46 square miles of water surface) in Wyoming, and several reservoirs in conneetion with irrigation projects, ( 70 square miles of water surface) in Montana, and reclamation of 2 square miles of Potomac River flats in Distriet of Columbia. ${ }_{2}$ Net reduction of 269 square miles due to drainage of lakes and swamps in Illinois and Indiana (201 square niles of land) building of Roosevelt and Laguna Reservoirs in Arizona ( 30 square miles of water surfaee) and overflow of Colorado River into Salton Sea in California ( 440 square miles of water surface).
    ${ }^{8}$ Increase of 194 square miles due to reelamation of 2 square miles of Potomac River flats in District of Columbia and 192 square miles of Lake Tulare in California.
    ${ }^{4}$ Includes Gadsden Purchase ( 29,628 square miles) in 1853.
    ${ }^{5}$ Ineludes Texas annexation ( 385,590 square miles) in 1845 ; Oregon territory ( 282,257 square miles) in 1846; and Mexican Cession (522,902 square miles) in 1848. 6 Includes Florida Purchase ( 54,861 square miles) and territory gained by treaty with Spain ( 12,862 square miles) in 1819.
    ${ }^{7}$ Includes Louisiana Purchase ( 817,885 square miles) of 1803.
    8 Includes the drainage basin of the Red River of the North.

    - Decrease of 25 square miles due to building of Roosevelt Reservoir and 5 square miles due to building of Laguna Reservoir.
    ${ }^{10}$ Decrease of 440 square miles due to overflow of Colorado River into Salton Sea. 11 Increase of 192 square miles due to reclamation of part of Lake Tulare, Califorma.

[^2]:    ${ }^{1}$ West Virginia was set off from Virginia Dec. 31, 1862; admitted as a state June 19, 1863.

[^3]:    ${ }^{1}$ The mathematical demonstration of this is simple. If $\mathrm{A}, \mathrm{B}, \mathrm{C}$, and D represent, respectively, the population of the northwestern, uortheastern, southeastern, and southwestern sections, then:
    $A+B=\frac{1}{2}$ population of U.S.
    $\mathrm{B}+\mathrm{C}=\frac{1}{2}$ population of U . S .
    $\mathrm{A}+\mathrm{B}=\mathrm{B}+\mathrm{C}$
    Therefore $\mathrm{A}=\mathrm{C}$
    Similarly it may be proven that $\mathrm{B}=\mathrm{D}$.

[^4]:    1 Movement from 1900 to 1920.

[^5]:    

[^7]:
