LETTER OF TRANSMITTAL

SMITHSONIAN INSTITUTION,
Washington, D.C., January 9, 1974.

Hon. CARL ALBERT,
The Speaker, U.S. House of Representatives,
Washington, D.C.

DEAR MR. SPEAKER: In accordance with Section 12 of Public Law 93-205, the Endangered Species Act of 1973, there is transmitted herewith the report of my review and recommendations.

Sincerely yours,

S. DILLON RIPLEY,
Secretary.

Report on
Endangered and Threatened Plant Species
of the United States

.....—————.....

Presented to the
Congress of the United States of America
by the Secretary,
Smithsonian Institution

15 December 1974

FOREWORD

The fact that few people are aware of the urgent need for preventing indiscriminate destruction of the vegetation of this country makes the presentation of this report indeed timely. The Endangered Species Act of 1973 and recently published reports on the environment reflect a growing national and even international concern over the current and future state of the biosphere--that part of the earth in which life exists.

The contemporary concept of human progress, based on materialistic values and exhibited in steel and concrete, seems to overshadow the more pressing needs of sensible preservation of natural resources and judicious utilization of the land itself. Many critical areas that contained the rarest of plants already have been destroyed, thus preventing future generations from ever seeing some of nature's treasures.

All animals are dependent on plants for food and survival. Once a species of plant is extinct, the potential contained in that germ or gene pool is lost forever. A diversity of plant species is required to supply human necessities and to maintain an ecological stability in the biosphere.

The Endangered Species Act of 1973 (Public Law 93-205, approved December 28, 1973) directed the Smithsonian Institution to prepare a list of endangered and threatened plant species, to review methods of adequately conserving these species, and to report the Institution's recommendations to the Congress.

This report provides lists of endangered, threatened, recently extinct, and exploited species of native plants of the United States. In the continental United States, this list comprises about 10 percent of the flora, 2099

species, with 100 species recently extinct or possibly extinct, 761 species endangered, and 1238 species threatened. Preliminary lists were compiled under the direction of Dr. Dale W. Jenkins, former Director of the Smithsonian's Ecology Program, with the assistance of the staff of the Department of Botany at the Smithsonian's National Museum of Natural History, particularly Dr. John J. Wurdack. The Hawaiian list of recently extinct, endangered, and threatened species was compiled by Dr. F. Raymond Fosberg with the assistance of other Smithsonian and Hawaiian botanists. Many distinguished botanists and organizations, listed in pages 192 - 198, also have aided in the preparation and review of the lists, and the versatility of the SELGEM computer system of the National Museum of Natural History made possible the generation of the computer printouts included in this report. The entire program was under the direction of Dr. Edward S. Ayensu, Chairman of the Department of Botany.

With staff support from the Office of Endangered Species and International Activities of the Department of Interior, a workshop was held by the Smithsonian Institution at River Farm of the American Horticultural Society. Outstanding botanists and representatives of various organizations reviewed and improved the preliminary lists, helped prepare recommendations for conserving plant species, and considered the possibility of new or amended legislation.

This report represents the beginning of an effort to keep accurate records of the endangered and threatened plant species of the United States. We are, however, mindful of the fact that the status of plants on the lists will change and that the lists, accordingly, should be revised on a regular basis.

Scientific names, which include genus, species, subspecies, and varieties, are used in this report because common names are not available for many of the plants, particularly the rarer or lesser known ones. In addition, the use of common names may cause confusion because they frequently refer to an entire

group of species, or even to different and unrelated genera. Moreover, the same species of plants may have different local names in different geographical regions. It is the hope of botanists that an attempt will be made some-day to standardize the common names of plants.

The report and the lists will, we hope, be of value to all people interested in conserving the nation's biological heritage, and to those concerned with the exploitation, development, management, and preservation of all natural resources in this country.

S. DILLON RIPLEY
Secretary
Smithsonian Institution

Workshop on Endangered or Threatened Higher Plants of the United States	192
Coordination	199

RECOMMENDATIONS

1. *Preservation of endangered and threatened species of plants in their native habitat should be adopted as the best method of ensuring their survival. Cultivation or artificial propagation of these species is an unsatisfactory alternative to in situ perpetuation and should be used only as a last resort, when extinction appears certain, with the purpose of re-establishing the species in its natural habitat.*

Habitat preservation must be given the highest priority in all conservation activities, particularly when dealing with the critical habitats of endangered species. Modification or destruction of critical habitats by human activities could result not only in a further reduction in population and distribution, but also in restriction of population expansion and recovery.

Transplantation and artificial cultivation should be a last resort, always with the ultimate objective of re-establishing the species in its natural habitat. Attempts to protect individual plants by fencing, for example, without preservation of the habitat or ecosystem upon which they depend will not provide successful perpetuation.

Protection and preservation of critical habitats and populations can be given high priority by landmark designations, conservation easements, acquisition, the institution of firm penalty procedures, and the habitats' designation as Natural Landmarks and Research Natural Areas.

2. *The species of endangered and threatened plants that occur on federal and state lands should be mapped and given continued protection. More specific attention should be given by federal departments and agencies to the prevention of destruction or modification of critical habitats of endangered and threatened flora in accordance with the Endangered Species Act of 1973 and the National Environmental Policy Act of 1969.*

The species of endangered and threatened plants on federal and state lands should be determined and exact locations should be mapped and made known to the appropriate authorities.

The Federal government could set a prime example of good policy by the protection of critical habitats of endangered plants and animals within the vast lands under its domain.

It would be advisable for the executive branch of the Federal government, through the Council on Environmental Quality, to give greater attention to endangered and threatened plant species in the reviews of environmental impact analyses and in the statements issued under the National Environmental Policy Act of 1969.

Federal agencies that are involved in land management (including the Bureau of Land Management, the Fish and Wildlife Service, the Bureau of Outdoor Recreation, the National Park Service, the Forest Service, the Soil Conservation Service, the Atomic Energy Commission, the Department of Defense) should be reminded that endangered and threatened plant species and their supporting habitats are basic natural resources in the agencies' land use plans and in their natural resource surveys or inventories. State and local land planning agencies and similar bodies should be encouraged always to include in their guidelines on planning legislation a list of endangered and threatened plant species and the supporting habitats.

3. In accordance with Section 4 of the Endangered Species Act of 1973, the Secretary of the Interior should review the lists in this report and publish proposed lists of endangered and threatened plants in the Federal Register.

The Secretary of the Interior is required by Section 4 to determine, after consultation, the endangered or threatened status of plant species and to publish the resulting lists in the *Federal Register*.

Official publication of the lists of endangered and threatened plants is needed to prevent commercial exploitation which may ensue once the lists become public knowledge. After such publication, under the provisions of the Endangered Species Act of 1973 the endangered and threatened plant species will be protected from exploitation or destruction until some of the most endangered can be given the special attention required to prevent extinction. Publication of the lists is necessary also for those agencies and groups involved in the preparation of environmental impact statements in accordance with the National Environmental Policy Act of 1969.

4. The Secretary of the Interior is advised to ensure that the commercially exploited species of plants in this report are given urgent protection. Appropriate government agencies should be alerted and existing laws should be fully enforced.

The international Convention on International Trade in Endangered Species of Wild Fauna and Flora, signed by the United States, gives authority to the Secretary of the Interior to protect fully those species presently listed in the appendices of the Convention. In the United States this list already includes all species of Cactaceae, Orchidaceae, and ginseng (*Panax quinquefolium*).

All appropriate federal and state agencies should be notified of those species listed by the Convention and of existing laws pertaining to their protection.

5. It is recommended that the list of the species of endangered and threatened plants in this report should be submitted by the Secretary of the Interior to the Convention on International Trade in Endangered Species of Wild Fauna and Flora for inclusion in Appendix III. This listing will enable the Secretary of the Interior, acting as the United States Management Authority to the Convention, to acquire lands for the preservation of endangered species of plants.

Trade in endangered and threatened plant species of the United States, whether international, interstate, or local, should be prohibited by presenting the lists of those species in this report for inclusion in Appendix III of the Convention. Article XVI of the Convention on the procedure for listing species in Appendix III states that any party's Management Authority may at any time submit to the Secretariat a list of species which it identifies as being subject to regulation within its jurisdiction, for the purpose of preventing or restricting exploitation, and requiring the cooperation of other parties in the control of trade.

6. Since protection alone may not be sufficient for the survival of some populations of endangered and threatened species, monitoring of population levels is needed. For declining populations, research is necessary to determine the causes of rarity and to ascertain what can be done to save the species.

Protection of plant habitats may be insufficient for the preservation of some populations of threatened and endangered species. Consequently, it is essential that monitoring of populations be undertaken to determine trends in their levels and viability. Monitoring of plant populations includes observation of population size (decline or increase), condition of habitats, reproduction, and any changes in geographical distribution.

Federal and state agencies involved in land management should monitor population levels in areas reserved, protected, or otherwise identified as refugia for one or more threatened or endangered species. These agencies should conduct scientifically based management programs, when necessary, to perpetuate the population. State agencies should be encouraged to conduct similar monitoring and management programs, including cost-sharing arrangements, for threatened and endangered populations on protected non-federal lands.

Research essential to development of management programs should be conducted where species continue to decline, and necessary management programs based on this research should be planned and carried out to maintain or increase population levels and viability.

Federal agencies and departments with research and/or land management programs already underway should be encouraged to conduct or sponsor expanded research on the biology of endangered and threatened species, investigation that is necessary to appraise the survival status of these species and to provide guidance for management in order to maintain, perpetuate, or restore the populations.

7. A "Registry of Endangered and Threatened Plants" should be established on a permanent basis to continue to collect, evaluate, and update all pertinent information available to interested national and international organizations.

A national registry office would be required to maintain such as register on a permanent basis, and to collect, evaluate, synthesize, and publish information on all endangered and threatened plant species, commencing with the vascular plants of the United States, including Hawaii and Alaska. The registry and coordination should include central card files and maps, a specialized library, use of a computer, and a small staff of experts. The register would require continual updating of information on the location, status, habitat requirements, reproductive behavior, population size, and commercial and private exploitation data on endangered and threatened species. The register should be available to the public.

8. *The lists of endangered and threatened plants should be given wide exposure and publicity. Colored illustrations should be displayed in public places, in publications, and on postage stamps. Interested organizations should be encouraged to assist in publicizing the need for protection and preservation of endangered and threatened species of plants.*

The lists and illustrations of endangered plants should be given wide exposure and publicity, and copies should be made available to appropriate organizations and to the public at large. Colored illustrations of endangered plant species of the United States should be prepared for general distribution and for prominent display at parks, nature reserves, museums, and tourist centers. They should be sent to botanical gardens, to horticultural, gardening, and conservation groups, and to educational establishments from elementary schools through colleges and universities.

Displays of this kind have been successful in Europe. For a number of years the Swiss have posted in public places colored pictures of rare and endangered species that are protected by law. Since the rich alpine flora is a great attraction and temptation to tourists, the intent of such displays is to make the public aware of the tenuous existence maintained by some populations of rare plants that people encounter.

In 1974 the Botanical Society of the British Isles published a poster in color, depicting 20 of the rarest endangered species in Great Britain. Simultaneously, a succinctly worded handbill in color was published and distributed to members of the Society. These items now are available to the public for a minimal charge and apparently are popular as decorative materials.

The larger area of the United States and the number of endangered and threatened species affords an opportunity for the preparation of *regional* posters that would emphasize the endangered species of particular states and

regions where endemism is high such as California and Hawaii, and those of selected natural areas. In addition, garden and horticultural groups should be asked to encourage and cooperate with local and state authorities in efforts to publicize these species.

The Federal government might consider the value of the publicity that would be afforded by a series of postage stamps portraying endangered and threatened plant species, as done by several other countries. In the United States only one listed species, the Lost Franklinia (*Franklinia alatamaha*), is shown on a stamp, issued in 1969.

9. No new federal legislation is required at this time. However, after a reasonable period, a review of the effectiveness of the Endangered Species Act of 1973 may be required to provide better protection to the endangered and threatened plant species.

The Endangered Species Act of 1973 appears to provide adequately for the protection of listed endangered and threatened species of wildlife and fish, but it differs for plants as follows: (1) The term "species" includes plant subspecies only and does not include varieties. (2) The Secretary of the Interior does not have the authority to acquire land for the purposes of conserving endangered and threatened plants that are not listed in the appendices to the Convention on International Trade in Endangered Species of Wild Fauna and Flora. (3) The Act does not prohibit the "taking" of endangered and threatened plant species in the United States.

SUMMARY OF ENDANGERED, THREATENED, AND EXTINCT SPECIES
OF NATIVE HIGHER PLANTS OF THE UNITED STATES*

Status	Continental U. S. (including Alaska)		Hawaii	
	species, subspecies, and varieties	percent	species, subspecies, and varieties	percent
Endangered.....	761	3.8	639	29.0
Threatened.....	1238	6.1	194	8.8
Extinct.....	100	0.5	255	11.6
Total.....	2099	10.4	1088	48.9

*Total native flora = 20,000 (United States with Alaska) 2200 (Hawaii).

REPORT

Introduction

Throughout the world much concern for conservation has been concentrated on the preservation of endangered animals, particularly mammals and birds. Only recently have endangered plants been given serious consideration. *Red Data Books* on endangered animals have been prepared for a number of years by the Survival Service Commission of the International Union for Conservation of Nature and Natural Resources (IUCN). The volume on birds in the IUCN series is prepared by experts from the International Council for Bird Preservation. A *Red Data Book*, volume 5, on angiosperms was started in 1970. It has been estimated that, of the approximately 300,000 species of plants of the world, over 20,000 are endangered or vulnerable and threatened with extinction by the year 2000.

In the United States, the preservation of endangered fish and wildlife was covered by the Endangered Species Acts of 1966 and 1969. These were expanded to include plants in the Endangered Species Act of 1973.

A Convention on International Trade in Endangered Species of Wild Fauna and Flora was adopted by a plenipotentiary conference on 3 March 1973 in Washington, D. C., and later signed by the United States. This convention undertakes to regulate the export, import, and transit of specimens and products of plant species threatened or not yet threatened with world-wide extinction.

This report includes the first national lists of endangered, threatened, recently extinct, and commercially exploited species of native vascular plants of the United States (including the states of Alaska and Hawaii. These endangered and threatened plant species are listed in taxonomic groupings

by families and in geographic groupings by states.

Recommendations to Congress are presented, and the value of retaining diverse plant species, causes of rarity, and preservation are discussed. The methods and criteria used in preparing the lists, the present status of the lists, and future needs and plans also are presented.

Many species of rare, endangered, and threatened plants grow in severe or unusual habitats and often possess unique qualities that make them particularly valuable to man: they help provide diversity and greater ecological stability, they stock unstable and unusual habitats, they are sources of medicines and other chemicals, they are bioindicators of minerals and metal ores, they possess potential value for food crops and horticultural use, and they provide man with sources of aesthetic value. Loss of any species of plant represents an irretrievable loss of unique genetic material or germ plasm that cannot be duplicated and narrows man's future options for his own use of the environment.

These lists should be of value to all people involved in the exploitation, development, management, and preservation of private and federal lands. They should also be of value to all agencies involved in preparing environmental impact statements in conformance with the National Environmental Policy Act of 1969. They should be of particular value to land use planners and conservationists in designating parks, natural landmarks, monument areas, and preserved natural areas.

The major recommendation made is for the preservation of the habitats of endangered and threatened species of plants. Cultivation or artificial propagation is not an acceptable alternative to *in situ* perpetuation of species. Not only preservation of habitats but also protection of the plants from commercial collecting, exploitation, and from overgrazing is recommended.

Value of Maintaining Diversity of Plant Species

Detailed knowledge about the endangered, threatened, and recently extinct species of plants is urgently needed. Plants are essential to maintenance of life on this planet. They are a basic component of man's environment. The diverse green plant cover of the earth--trees, shrubs, and wild flowers--is one of the most important features in making man's environment livable, delightful, and beautiful. Even more significant, plants fix solar energy in the form of carbohydrates and are vital sources of food, fiber, shelter, and fuel required for man's very existence. Thus, human beings, as well as domestic and all other species of animals, are dependent on plants for their survival. A wide variety of plant species is essential to the maintenance of the environment in a livable condition in order to prevent wind and water erosion and to aid in developing fertile soil, in storing water, and in maintaining or providing subsurface water. A wide diversity of plant species and populations, therefore, is required to stock the many different habitats and ecosystems of the earth and is necessary to maintain ecological stability. Man's own monocultural system of agriculture has taught him much about the problems of ecological stability in the need for protection from diseases, insect pests, weeds, depletion of soil nutrients, and similar ecological problems.

Each species, subspecies, and variety of plant represents a unique type of biological germ plasm, or gene pool, with special characteristics and values. These unique genetic resources are specific and different. When one of these types becomes extinct, the gene pool cannot be duplicated or re-established and is lost forever. Each extinct species narrows man's options in the potential uses of the known or unknown values of each gene pool. Imagine the loss to mankind if the bread mold *Penicillium* had been eliminated before the discovery of the first antibiotic, penicillin, or if cinchona had been destroyed

before quinine was discovered as a cure for malaria.

A large untapped potential of enormous value to man exists if he preserves the diversity of plant species. It has been estimated that 50,000 new alkaloids can be discovered in plants, including possible cancer cures. New plant medicinals and drugs presently are being discovered. Using yams as a natural intermediate in the search for cortisone precursors illustrates a valuable shortcut in a normally lengthy and expensive chemical synthesis. An effective molluscicide from pokeweed recently was discovered for the control of snails transmitting schistosomiasis, a disease that affects over 200 million people. Plants not only produce natural biologically active chemicals such as insecticides but also provide man with the chemical structures to synthesize even more effective chemicals and pesticides. They even indirectly affect research: the attempts to synthesize quinine gave a new impetus to organic chemistry.

Development of new and improved food, fiber, and timber crop species is a very important potential. With improved technology, man is able to utilize new species and to improve plant production and yield by genetic selection and the use of biologically active chemicals. Improved use of fertilizers, integrated biological control, and use of pesticides will help in alleviating food shortages, now a major and growing world problem. Man will need all of the different types of plant germ plasm possible to increase future food production.

In addition to developing untapped potentials, man also must preserve the ancestors of the present crop plants to provide protection against plant diseases and insect pests and to ensure vigorous and basic stocks for future breeding. The progenitors and relatives of corn, wheat, rice, and similar crops must be preserved in their present genetic state, and they must be protected from cross-breeding and hybridization with newer stocks in order to preserve their original values. Some ancestral stocks such as certain progenitors

of corn are very rare and some apparently are extinct. The ancestors of fiber, timber, and horticultural plant species also should be preserved.

It should be pointed out that many species of rare plants have special value to man since they are able to grow in unique and difficult places such as serpentine rock, cedar and shale barrens, sand plains, shorelines, rock faces, mountain tops, and flooded areas. Thus, these rare species have special characteristics that give them unique value in stocking such habitats. Some rare species also are bioindicators of needed minerals and metal ores. Many rare species, e.g., cacti and orchids, possess known or potential horticultural value. Others, such as ginseng and golden seal, are of medicinal value. In fact, these valuable characteristics often are the very cause of rarity, endangerment, or extinction of many species of plants.

Status of Lists

These are the first published lists of endangered, threatened, and recently extinct species of native plants of the United States. Because of the necessity for meeting a deadline, the lists have been compiled in a relatively short period of time. Excellent cooperation has been received from many taxonomic specialists and local botanists, but the present lists lack the benefit of a thorough and complete review by specialists in all taxonomic groups of plants and by local experts on the flora of certain regions.

The lists, therefore, should be considered at the present time as a "snapshot" of the status of higher plants. This status is changing, knowledge is increasing, and species may be removed or added to the lists, which will continue to be improved and updated.

Definitions of Plant Status

In determining endangered, threatened, and recently extinct, or possibly

extinct status, the entire range of the species or other recognized taxonomic unit is considered. A species that is rare in one area or state is not included if it is common elsewhere in its range. (In the future, it may be advisable to include in the lists interesting disjunct populations and species that have become rare or extinct over a significant part of their range.)

Since the status of rarity and endangerment as defined in the Endangered Species Act of 1973 applies primarily to animals, the definitions have been modified slightly for plants, and the following terms and meanings presently are agreed upon by the contributors to this report.

Endangered species: those species of plants in danger of extinction throughout all or a significant portion of their ranges. Existence may be endangered because of the destruction, drastic modification, or severe curtailment of habitat, or because of overexploitation, disease, predation, or even unknown reasons. Plant taxa from very limited areas, e.g., the type localities only, or from restricted fragile habitats usually are considered endangered.

Threatened species: those species of plants that are likely to become endangered within the foreseeable future throughout all or a significant portion of their ranges. This includes species categorized as rare, very rare, or depleted.

Recently extinct or possibly extinct species: those species of plants no longer known to exist after repeated search of the type localities and other known or likely places. Some species may be extinct in the wild but preserved by cultivation in gardens--such as the "Lost Franklinia."

The above definitions define the status categories, but this report is initially concerned with rarity. A rare species of plant is one that has a small population in its range. It may be found in a restricted geographic region, or it may occur sparsely over a wider area. When a rare species, sub-

species, or variety of plant appears on a list categorized as endangered, threatened, or possibly extinct, it becomes particularly subject to two critical questions:

1. Is the plant species or subspecies a valid taxon? Perhaps it is (a) a synonym or nonvalid segregate of a more common or widespread species or (b) a rarely produced hybrid, polyploid, aberrant, sport, or unusual phenotype owing to some unusual condition or stress.
2. Is the species truly extinct? Perhaps it really occurs in small numbers or is more common or widespread but has not been observed or collected because (a) it is small, inconspicuous, or occurs in hidden habitats, (b) it blooms rarely, briefly, or at unusual times, germinates infrequently or has long dormant periods, or (c) it occurs only in difficult or inaccessible terrain or habitats rarely visited by collectors.

These are questions that must be answered in order to develop accurate and valid lists. Some are difficult to answer; others may never be answered. At any rate, changes in status are expected with new information.

Development of Lists

The lists were prepared by reviewing the best available published floras of regions, states, and localities of the United States. Species with very limited distributions or a rare status were listed and all available data compiled. These and additional species were reviewed in the latest available taxonomic monographs and revisions, collections were checked in herbaria, and taxonomic specialists were consulted. Synonymy and changes in taxonomic status were determined. The lists then were compared with available state lists of rare and endangered plants. For species endemic to a single state, the rarity status given in the state lists proved to be valuable; however, for the more

wide ranging species, the local designations of abundance in the state often had only limited value for the national lists.

Special data cards used in preparing the lists permitted compilation of all available information on taxonomy, habitat, former and present distribution (in detail, including counties), present rarity and status, endangerment, and threats, with the authorities and references cited.

The data from the species cards were entered into a computer and printed out in lists according to family, species, state, and rarity and endangerment status. These lists included only the vascular plants: angiosperms (flowering plants), gymnosperms (pines and relatives), and pteridophytes (ferns). The lower plant groups--algae, fungi, lichens, mosses and liverworts--were not included at this time.

Only species that are indigenous to the United States (including Alaska and Hawaii) are included. If a rare species occurs outside of the United States as well, it is not included unless the exact status of its rarity, endangerment, and distribution outside of the United States is known. Most species with ranges outside of the country have been excluded since data on their ranges and status generally are not available. No introduced, adventive, naturalized, or domesticated species are included.

Species and well recognized subspecies and varieties are included, but the forms, races, apomicts, and hybrids are not. In some genera, such as *Crataegus* (hawthorns) and *Rubus* (blackberries), hybridization between species has produced a plethora of forms that have been given various taxonomic ranks and frequently have been designated as species by some botanists. Because of taxonomic disagreement in such genera, doubtful species are not dealt with in the present list.

A species extinct in one state may be very common in another, and therefore it would have no place in this national list. A species also may be rare

at the edge of its range but itself not endangered.

The distribution and abundance of the flowering plants of the United States are fairly well known, but there are many gaps in knowledge, unknown geographic areas, and some undescribed taxa. In comparison with the flora of the British Isles, the United States flora has been studied less intensively, but compared with the flora of South America, it is well known. The northeastern United States (*Gray's Manual of Botany* range) is quite well known. The southwestern flora needs much work, and there are no recent accurate state floras for any of the states from Florida through Louisiana. Fortunately, Texas, California, and the Pacific Northwest recently have been studied, and the flora of the intermountain basin states of the west is being published. Although several floras of Alaska have been published, much exploration is needed. The highly endemic Hawaiian flora is fairly well documented.

In addition to the floras, monographic revisions have been issued for various families, genera, and other taxonomic groups. These are of major importance in compiling lists of endangered, threatened, and recently extinct species, particularly for determining the correct scientific name and status of species, subspecies, and varieties. The monographs often contain distribution maps of the species treated.

About 30 states of the United States have developed lists of rare and endangered plants, some of which are excellent and scientifically accurate. Others are merely lists of wildflowers that should not be collected but are not actually rare or endangered. Most of the states have different systems of classification for the various categories as well as methods for determining the status of rarity and endangerment.

Some states have active committees (often volunteer) working on endangered and threatened plants. Some have compiled lists, have assigned categories, and

have actively revised and published the lists on a regular basis. Other states have concerned individuals or informal groups that compile lists. These groups or individuals may function as a part of state agencies, universities, or private organizations. Many of the states have meetings or work groups that organize and coordinate efforts within the state. Nearly all states have botanists occupied with compiling or revising a state flora and in checking on the status of species within the state. All available reports of rare and endangered plants from the various states have been utilized in preparing these national lists.

Value of Lists

These lists will provide scientific information necessary to help preserve those species of plants that are endangered or threatened. They specify which species should not be exploited commercially, or collected, or picked by individuals. They should provide guidelines to federal and state agencies and to interested conservation groups.

The lists should be of value to land use planners and to all agencies involved in preparing environmental impact statements in conformance with the National Environmental Policy Act of 1969. An awareness of the endangered and threatened species of plants should be urged upon all people involved in the exploitation, development, management, and preservation of the land.

A major value of the lists should be to assist in the selection of areas for preservation and in the designation of natural areas to be protected. Without the benefit of such lists in past years, these decisions often have been based more on endangered animal species, interesting or scenic geological areas, or the preservation of unique habitats and forest types. The lists should prove to be of much greater value when the geographic distribution of each

species has been plotted accurately on maps.

The lists should also stimulate detailed reviewing and checking of the status of the species and should result in revised and more accurate lists next year. More extensive field study of the listed species undoubtedly will result in the discovery of more populations, with the resultant removal of some species from the endangered, threatened, and recently extinct categories.

Future Plans

During 1974 it has been possible to compile lists for the United States, including Alaska, the Aleutian Islands, and the Hawaiian Islands. These lists include flowering plants, pines, ferns, and their relatives.

For next year, plans are underway to update and improve the lists and to map the species distributions. The geographic areas covered will be extended to include the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Trust Territory of the Pacific Islands. Lower plants, including algae, fungi, lichens, mosses, and liverworts, will be studied in the future.

Mapping of the distribution of the endangered and threatened species will provide information as to which species already occur in protected areas such as parks, preserves, and natural areas, which species are most threatened, and which need to be given protection. Mapping also will permit the designation of centers of endemism and aggregation of species to assist in preserving areas for their protection.

Causes of Rarity and Endangerment

The distribution and the abundance or rarity of plant species result from a large number of factors, not only naturally caused but often man-caused. Species have developed, spread, retreated, and some have become extinct throughout millions of years of geological history. Development and extinction of

species is usually a long, slow process. Man, however, has sped up the process in the twentieth century because he has greatly modified the surface of the earth with his highly advanced technology. In the past (and certainly at present) he has shown an almost total lack of concern for the plant and animal species that share the planet with him. As a result, many species of plants recently have become extinct, and a large number are highly endangered unless they are provided quickly with special protection or the removal of threats.

The long, slow geological and climatic changes that have taken place on earth have resulted in the development of new species, the extinction of species, and changes in their distribution and abundance. Some of the major natural factors that affect plants are uplift or sinking of land, development of mountain ranges, volcanic eruptions, flooding, development of islands, erosion, glaciation, xerothermic periods, droughts, expansion of deserts, eutrophication (filling of lakes and ponds), and fire.

Natural biotic factors also affect the distribution and abundance of plants. Among the most important are newly evolved competitive species (with increased vigor), plant diseases, animal damage from overgrazing, insect damage, and the destruction of seeds and fruit. When species become very old or senescent, such as small populations of relicts from floras of older geological periods, they may suffer genetic depletion or loss of genetic variability and become inbred and unadaptive or develop narrow specialization that results in their rarity and perhaps extinction.

Natural factors act over long periods of time with the result that the development and loss of species probably has been fairly well balanced. Stress factors, mentioned above, not only result in extinction, but also they can result in the development of new species.

Man has changed drastically the surface of the earth as a result of his

enormously increased population and his technological advances. The building of more dams and power plants, strip mining, shale oil recovery, increased irrigation and agriculture, development of cities, roads, factories, with the resulting dumps and pollution, are further threatening to destroy or modify more of his natural environment.

Plant populations often are reduced severely by the activities of man, particularly in the destruction of habitats as well as in the destruction of plants and plant parts themselves. Plant habitats are destroyed outright by bulldozing, subsurface mining, strip mining, flooding, irrigation, agriculture, overgrazing, fires, and the lowering of water tables by wells and drainage.

Plant populations are destroyed directly by man as the result of commercial or private exploitation, with the collection of entire plants, their seeds, fruits, or flowers. Despite the high frequency of unsuccessful transplants from the wild to cultivated gardens, collectors of rarities persist in causing serious damage to critical species. Timber removal, particularly clear cutting, with the resultant erosion, is a major and direct method of destruction.

Man has accidentally or purposefully introduced over 1800 species of foreign vascular plants that are adventives or escapes, some of which have become naturalized or have been cultivated in the continental United States. Nearly 2000 species have been introduced into Hawaii in this manner. Many of these species are aggressive weed pests that choke agricultural crop fields, damage lawns and pastures, and overgrow lakes and waterways. These introduced species, when free of their native diseases and pests that formerly held them in biological balance, often win out in competition with the native species. By taking over the habitats of rarer native species, they contribute to the increased rarity of many of these endangered or threatened plants.

Plant species and populations are destroyed indirectly or changed as a re-

sult of various other activities set in motion by man: overgrazing by goats, cattle, sheep, and pigs; inadvertent or purposeful introduction of noxious weeds or other highly competitive species; introduction of plant diseases, insects, and other animal pests; use of chemicals, fertilizers, herbicides, and other biocides, which include air, water, and soil pollutants; and the destruction of pollinators such as insects, birds, and bats. The local introduction of diseases, insects, birds, or other organisms may result in a spread over the entire continent, with serious unknown effects until after the damage is done.

Preservation

Preservation of rare species of plants requires the preservation and protection of the habitats upon which they depend for growth and reproduction. *In situ* perpetuation of sufficient populations of endangered and threatened plants is required to ensure their survival.

Three key elements are involved in this *in situ* perpetuation: (1) prevention of the destruction of populations and their habitats; (2) maintenance or enhancement of the population levels and viability; and (3) prevention of collection and commercial exploitation.

Cultivation or artificial propagation, even in the best botanical gardens, is not an acceptable alternative to *in situ* perpetuation of species. Preservation of a species' future cannot be assured in this way. Artificial propagation is a last resort and is done always with the ultimate objective of reestablishing the species in its natural habitat.

Prevention of the Destruction of Plant Habitats

It is essential that habitat preservation be recognized as the critical factor in all conservation activities and in legislative and executive acts, amendments, orders, and regulations.

Since preservation and protection of endangered and threatened plants depends primarily on the preservation of their habitats--with about 2000 endangered and threatened species--it is not practical to attempt to preserve individual species.

A more practical method for preservation involves the mapping of all the species ranges to determine the aggregations or centers of endangered species. Many are known to occur together in unique habitats such as isolated mountain tops, former or present lake or river shores, and protected areas in valleys and canyons. Specialized habitats such as serpentine barrens, cedar glades, disjunct bogs, sand dunes, and other sites also may harbor endangered species. A bank of the Apalachicola River in northwest Florida, for example, has a concentration of 14 endemic rare and endangered species found only in that location.

Rare and endangered species are usually narrow endemics, i.e., they occur only in restricted ranges. In the United States there are several major centers of endemism or areas with concentrations of endemic species known only from specific regions: Florida, the southern Appalachian Mountains, Texas, and California. There is also considerable endemism in the southwestern region comprising Nevada, Arizona, and Utah, and in the Pacific Northwest of Oregon and Washington. Endemism occurs to a limited degree in the northeastern states, with some in the Ohio River Valley, but it is very limited in the glaciated area of the Great Lakes region, and it is lowest in the extensive Great Plains region. Knowledge about endemic centers and aggregations of species is of considerable value in determining and establishing priorities for preserving land to protect these plants.

A variety of methods can and should be used for protecting and preserving habitats and populations, including landmark designations, conservation easements,

acquisition, and penalty procedures. These methods should be fully explored and the findings made available for use in appropriate cases through executive and legislative action.

Much protective activity can be accomplished in the existing preservation programs: (1) the National Park Service should incorporate the list of threatened and endangered species as criteria in its Natural Landmark Program (by being included in the regional natural landmark surveys, endangered and threatened species populations could be made eligible for designation as Natural Landmarks); (2) the Federal Committee on Ecological Reserves should encourage natural area programs in the states to do the same.

Endangered and threatened plants should be recognized as basic elements in land use plans and inventories when the Federal government is involved either in a direct capacity or in the role of a guiding or advisory party: (1) Federal agencies involved in land management, including the Bureau of Land Management, Fish and Wildlife Service, National Park Service, Forest Service, Atomic Energy Commission, and Department of Defense, should recognize threatened and endangered species as natural resources and include their populations and supporting habitats as elements in these agencies' natural resource surveys or inventories, as seen in the recent Forest Service Multi-Resource Inventory Act (Humphrey-Rarick Bill); (2) state and local land planning agencies and bodies should be encouraged to include threatened and endangered species in the agencies' planning, with particular attention to the plants' critical supporting habitats; for example, the Office of Land Use and Water Planning should include these species in its guidelines to the states and should also incorporate the lists as elements in any national land use planning legislation.

Monitoring and Research

Protection of plant habitats may be insufficient for the preservation of

some populations of threatened and endangered species. Consequently, it is essential that monitoring of populations be undertaken to determine trends in their levels and viability, that research essential to development of management programs (based on this research) be planned and carried out to maintain or increase population levels and viability.

In developing the plans for preservation and protection of rare species, it will be necessary to understand the reasons for the rarity of each species and the specific causes of endangerment. Rare species may be local endemic species occurring in small geographical areas or in highly specialized habitats. They may be limited to refugia, or protected places, where, owing to special factors, they can persist.

The habitats of rare plants often are unstable or geologically young areas with unique characteristics that prevent the growth of highly competitive, aggressive species: sandy pine barrens, talus slopes, cedar barrens, shale barrens, serpentine barrens, acid bogs, mountain tops, rock cliffs, ravines, sandy shores, islands, peninsulas, river banks, and hot, alkaline, or salt springs.

Many species occur in the pioneer or early stages of ecological succession in a given region. It is an interesting fact that many species of rare plants of diverse geographic affinity often are found congregated in these habitats. The rare species growing on specialized substrates, such as serpentine, are not restricted to the substrate but are preserved from extinction caused by competition with other plant species when the latter are unable to grow on serpentine.

Endemic species are those with restricted or limited geographic distribution. These may be relict species that are ancient, that show little variability, that are highly restricted to specific habitats, and that may be on their way to extinction; for example, the Giant Sequoia (*Sequoiadendron giganteum*),

the Florida Torreya (*Torreya taxifolia*), the Florida Yew (*Taxus floridana*), the Lost Franklinia (*Franklinia alatamaha*), and the Georgia Plume (*Elliottia racemosa*) with its low fertility, poor germination, and difficult regeneration from cuttings. Relict rare species that occur in small populations can lose their store of genetic variability and become depauperized. Extinction thus can result from a narrow specialization to a restricted habitat. Many rare species, however, that once were highly restricted in range grow well when introduced into other areas. The Lost Franklinia was known only from a habitat of about two acres in Georgia; now it grows well in cultivation in Great Britain, Washington, D. C., New Jersey, and other areas.

Other rare species are newly evolved and have not yet had time to occur in a wider range. These often are aggressive and capable of withstanding various threats.

If the biology of the rare species, therefore, is understood, effective action can be taken to help preserve them.

Prevention of Commercial Exploitation

According to Section 4 of the Endangered Species Act of 1973, the Secretary of Interior should publish these lists of endangered and threatened plant species in the *Federal Register* simultaneously with, or immediately after, the presentation of the "Smithsonian Report" to Congress. Further, a legal search should be made to ascertain the most rapid means to implement the Act's ban on commercial exploitation.

Speed in application of the Act's clauses on collection, transport, and sale of endangered and threatened plants should have the status of top priority following publication of these lists. The longer the period between the report's appearance and legal application of the Act, the greater becomes the danger of last-minute and extensive predation on commercially exploitable species.

The sections of the Act relating to collection, transport, and sale of endangered and threatened animals should be applied equally to endangered and threatened plants, particularly the section on the ban of commercial trade in endangered species.

Since a relatively small number of the endangered plant species are used in commercial trade, effort should be concentrated on monitoring those species in enforcing the Act. This subset of species likely to appear in commercial trade is identified in a separate list of commercially exploited species.

A potential danger involved in public listing of endangered species is the possible pressure that might be put on the remaining endangered or threatened plants by well-meaning but misguided persons who think that they should dig up the last specimens from their native environment to "grow" them in their own gardens--usually with fatal results. This problem must be clearly stated, and appropriate warnings should be issued.

LIST OF COMMERCIALY EXPLOITED SPECIES
IN THE CONTINENTAL UNITED STATES

This list of commercially exploited species is incomplete; comparison of plant catalogs with the endangered and threatened lists would result in a much longer list.

Commercial plant catalogs usually quote the highest prices for the endangered and threatened species, with accompanying comments on their rarity and desirability. Most of these plants are collected from the wild. The dealers specialize in selling rare cacti and other succulents such as *Dudleya* and *Sedum*, lilies of many types, iris, some orchids, and many flowers such as primula, columbine, and mallows. Various palms, cycads, and flowering shrubs, including *Rhododendron* and *Amoreuxia*, are advertised. There is a very large trade in the sale of exotic-looking carnivorous plants, such as the Venus Fly Trap, and pitcher plants, including *Darlingtonia*.

Commercial dealers in some cases will collect these species by the truckload from the wild and sell them immediately or shortly after having transplanted the plants into gardens. Cacti suffer the greatest threat; many commercial dealers have a large trade in potted cactus plants.

Since commercial dealers usually know the rarity status of the plants that they are collecting from the wild, dealers can be controlled more effectively than the gardening public, who collect whatever is attractive and unusual. It is important to make readily available to the public illustrations of endangered but exploited species, as done in Europe, particularly for rare and endangered alpine plants.

Efforts should be made to end the fad for rarity by discouraging dealers from advertising the rarity of their offerings. Instead, advertising emphasis should be directed to conservation of species grown from seed and not collected from the wild. Dealers and the public should be encouraged to leave endangered flowers undistrubed or only to photograph them carefully *in situ*.

Many species cannot be transplanted; if any roots are broken or damaged, the plants will die from fungus or disease. This is especially true for certain rare orchids. Since the growing habits of many species of rare and endangered plants are specialized to the frequently unusual habitats in which they occur, these species are particularly difficult to grow or to have reproduce in cultivation.

An informed public could decrease significantly the commerical and private pressure under which these exploited species survive.

LIST OF RECENTLY EXTINCT AND POSSIBLY EXTINCT SPECIES
OF HIGHER PLANTS IN THE CONTINENTAL UNITED STATES

"Extinct" is a term that probably is too strong and definitive to use for plant species that, on available evidence, have "disappeared" during the last three hundred years. Knowledge of the flora usually is not sufficient to state with complete certitude that a species is recently extinct. Accordingly, most of these plant species have been labeled "probably or possibly extinct," or "extinct in the wild but cultivated."

For plants that occurred during past geological periods and that are known only from fossils, it is safe to use the term "extinct." Even some species known only from fossils, however, have been discovered later to be living in an isolated refugium. Except for fossils, therefore, the designation "recently extinct" means merely that, after a species was described and known, it disappeared and could not be rediscovered even with repeated searches over a number of years in the type locality and similar or likely places. There is always the possibility that species categorized as "recently extinct" will be rediscovered, especially those occurring in difficult terrains seldom visited by collectors.

Names of the species included in the "recently extinct" or "possibly extinct" lists have been gathered from the literature, herbaria, and various specialists. Considering the very large area of knowledge involved, however, and the numerous botanists and other specialists who may have in hand unpublished data on various species, it has not been possible to contact all possible sources of information. Publication of this initial list should stimulate such persons to publish or otherwise make available their own valuable

data. In addition, the list should stimulate intensified field studies and research to rediscover or validate the extinction, rarity, abundance, and threat status of some species and the taxonomic validity of other, lesser known species.

Species, subspecies, or varieties extirpated or "extinct" in one state but found elsewhere are not included in this list. Species extinct in the wild but living in cultivation are included with appropriate notation. The original listing was fairly extensive, but many species have been deleted as new and unpublished data became available; e.g., *Petalostemon reverchonii* in Texas was considered to be extinct since 1880, but recently it has been re-discovered. As the list is being updated, it is hoped that deletions will continue to be made. At present there are 100 kinds of plants listed, which means that 0.5 percent of the plant species of the United States probably are now extinct--an irretrievable loss.

Species and Varieties	Locality	Date Last Collected	Status*
Poaceae (continued)			
<i>Disantherium californicum</i>	Santa Catalina and San Clemente islands, Calif.	1912	PrEx
<i>Festuca dasyclada</i>	Joe's Valley, Colorado R., Utah	1875	PoEx
<i>Panicum shastense</i>	Castle Crag, Shasta Co., Calif.	1912	PrEx
<i>Pleuropogon oregonus</i>	Union and Lake Cos., Oreg.	1901	PoEx
<i>Trisetum orthochaetum</i>	Missoula Co., Mont.	1908	PrEx
<u>Polygonaceae</u>			
<i>Chorizanthe valida</i>	Marin Co., Calif.	1962	PoEx
<i>Eriogonum ericifolium</i> var. <i>ericifolium</i>	Yavapai Co., Ariz.	1887	PoEx
<i>Eriogonum lemmonii</i>	Washoe Co., Nev.	1875	Ex
<i>Polygonum montereyense</i>	Monterey Co., Calif.	1917	Ex, Tax?
<u>Potamogetonaceae</u>			
<i>Potamogeton floridanus</i>	Florida	1886	PoEx
<u>Rosaceae</u>			
<i>Potentilla multijuga</i>	Ballona, Los Angeles Co., Calif.	1849	PrEx
<u>Ranunculaceae</u>			
<i>Ranunculus acriformis</i> var. <i>aestivalis</i>	Sevier R., Utah	1960	PrEx
<u>Saxifragaceae</u>			
<i>Lithophragma maximum</i>	San Clemente Is., Calif.	1936	PoEx

Species and Varieties	Locality	Date Last Collected	Status*
<u>Scrophulariaceae</u>			
<i>Agalinis (Gerardia) stenophylla</i>	Tampa, Hillsboro Co., Fla.	1897	PoEx
<i>Bacopa simulans</i>	Charles City Co., Va.	1941	PrEx
<i>Castilleja leschkeana</i>	Point Reyes, Marin Co., Calif.	1960	PoEx
<i>Castilleja ludoviciana</i>	Jeff Davis Parish, La.	1915	PoEx
<i>Cordylanthus mollis</i> ssp. <i>mollis</i>	San Francisco Bay, Napa Co., Calif.	1966	PoEx
<i>Cordylanthus palmatus</i>	Colusa, Fresno, Madera, Merced, and Yolo Cos., Calif.	1970	PoEx, Cult, Reintro to wild
<i>Mimulus brandegeei</i>	Santa Cruz Is., Calif.	1932	PrEx
<i>Mimulus traskiae</i>	Santa Catalina Is., Calif.	1904	Ex
<i>Orthocarpus pachystachyus</i>	Shasta R., Siskiyou Co., Calif.	1913	PoEx
<i>Pedicularis furbishiae</i>	Aroostook Co., Maine	1943	PrEx
<i>Seymeria havardii</i>	Maverick Co., Tex.	1882	PrEx
<u>Solanaceae</u>			
<i>Lycium hassei</i>	Santa Catalina and San Clemente islands, Santa Barbara, and San Diego Co., Calif.	1936	PoEx
<i>Lycium verrucosum</i>	San Nicolas Is., Ventura Co., Calif.	1901	PoEx
<u>Sterculiaceae</u>			
<i>Nephropetalum pringlei</i>	Hidalgo Co., Tex.	1888	PoEx

Species and Varieties	Locality	Date Last Collected	Status*
<u>Theaceae</u>			
Franklinia alatamaha	McIntosh Co., Ga.	1803	Ex, Cult
<u>Valerianaceae</u>			
Valerianella texana	Gillespie Co., Tex.	1936	PoEx

*Ex = Recently extinct or extinct in wild: not collected during extensive search over a number of years; type locality or sites may be destroyed.

PrEx = Probably extinct: not recollected after one or a few visits to the type locality and/or similar sites.

PoEx = Possibly extinct: not recollected or known only from type locality for a number of years; may not have been searched for.

Tax? = Taxonomic status in doubt, perhaps owing to scarcity of material; possible hybrid.

Cult = May be extinct in nature, but the plants are in cultivation or have been transplanted.

LIST OF ENDANGERED SPECIES IN THE CONTINENTAL UNITED STATES

Endangered species of plants are in danger of extinction throughout all or a significant portion of their range. These plants usually are rare, with limited geographical distribution, and often occur in fragile, threatened habitats.

Endangered species are more immediately in danger than threatened species and may become extinct unless they are provided with protection or removal of threats to their existence. Some endangered species have little reproductive capability and are so narrowly endemic or specialized to a certain habitat or specific condition that they are unable to withstand any threats or dangers that normally would not threaten most plants. At the present time, 761 kinds or 3.8 percent of the native higher plants are considered to be endangered in the continental United States.

Also included in the endangered plant list are 100 kinds of plants considered as "recently extinct," "probably extinct," or "possibly extinct." These are included in the list in order to provide them with protection if they are rediscovered as the result of more intensive searches. If they are rediscovered, they will be included automatically in the endangered category unless another status is determined.

As the flora is studied better, many species certainly will be removed from the endangered list and placed on the threatened list or deleted as a result of the discovery of more populations or wider distribution of a species. Also, some endangered species can be expected to become extinct. This list,

accordingly, should be considered as the list with the most complete and accurate information available at the present time.

LIST OF THREATENED SPECIES IN THE CONTINENTAL UNITED STATES

Threatened species of plants are those that presently are not endangered but are likely to become so within the foreseeable future throughout all or a significant portion of their range.

Threatened plants are usually rare, with a restricted range, or they occur in specialized habitats. They are less likely to occur in highly fragile habitats; if they do, they usually are not subjected to severe threats by man or other agents. The threatened category is somewhat difficult to differentiate from the endangered, but usually it includes species that occur in larger populations, that occur over a wider geographic range, or that have populations growing in protected areas such as parks. The difference between "threatened immediately" versus "threatened in the foreseeable future" is also difficult to differentiate because conditions often can change rapidly. If large areas are threatened suddenly by shale oil recovery operations, for example, many threatened species would have to be reclassified in the endangered category.

At present, about 1238 kinds, or 6.1 percent, of the native flora of higher plants of the continental United States are in the threatened category.

STATE LISTS OF ENDANGERED AND THREATENED SPECIES IN THE CONTINENTAL UNITED STATES

These state lists of endangered and threatened plants are the species, subspecies, and varieties of plants on the national list that also occur in each state. Since many of the species are found in more than one state, they are listed, accordingly, in all of the states in which they do occur.

The selection of species on the national lists has been based on different criteria than the separate lists developed by the various states. As indicated earlier, the national lists are based on the total range and abundance of a species. Rarity and distribution data from various local state lists were considered in developing the national lists, but the state categories are, by definition, limited. A species that is listed as rare and endangered within a state's borders but that is abundant in another state would not be included in the national lists.

Disjunct or isolated occurrence of a species, rare in a state and far removed from areas where it is abundant, is biologically interesting and could be of taxonomic and/or ecological importance. It was not possible to include these disjunct distributions in the present lists unless the species was found to be rare throughout its total distribution. Nearly all species are rare at the periphery of their distributions, and especially is this true in disjunct populations. These factors should be considered in future revisions of the national lists.

The nationally endangered and threatened species on the state lists presented herein should be given added importance by the states in comparison with locally endangered and threatened species that are common elsewhere.

The latter, however, have significance in local lists for the states involved.

These lists of nationally endangered and threatened plant species should be of assistance to the various states in the establishment of state natural areas and parks for protecting and preserving these species as well as for developing needed state laws for plant protection.

STATE LISTS OF ENDANGERED AND THREATENED SPECIES OF THE CONTINENTAL UNITED STATES

LIST OF ENDANGERED, THREATENED, AND RECENTLY EXTINCT SPECIES OF HAWAII

Island floras are particularly vulnerable to threats from man. The Hawaiian Islands flora, subjected to severe human mistreatment, is one of the most fragile in the world. This depredation has resulted in the phenomenon of over 50 percent of the entire flora being placed in the categories of recently extinct, endangered, or seriously threatened species.

The total native indigenous flora of the Hawaiian Islands includes over 2200 species, subspecies, and varieties. Of these, 1088 kinds are listed in critical or threatened status.

The number of "recently extinct," "probably extinct," and "possibly extinct" species is very high. Over 255 kinds, or about 11.6 percent, are "extinct." It is always possible, at a future date, to find individuals of a species that has been listed as recently or probably extinct or to find that the species, while extinct in the wild, is cultivated somewhere in the world.

The number of endangered kinds of plants is 639 or 29 percent. The number of threatened kinds of plants is 194 or 8.8 percent.

Many rare species were included previously in the preliminary lists, but insufficient information was available on the exact endangerment or threat, with the result that they were listed in a category of "uncertain." These have been deleted in the present list, but it is recognized that many or perhaps most of them may be threatened and some may be endangered or extinct. It is certain that the list of plants in critical or threatened status is much larger than shown.

These lists have been taken from the extensive study by Fosberg and Herbst, who have listed 1690, or 80 percent, to be considered sufficiently threatened to be placed in their list of "Rare and Endangered Species of Hawaiian Vascular Plants."

LIST OF ENDANGERED, THREATENED, AND RECENTLY EXTINCT SPECIES OF HAWAII

FAMILY	SPECIES	STATUS
AMARANTHACEAE	ACHYRANTHES MUTICA	ENDANGERED
AMARANTHACEAE	ACHYRANTHES SPLENDENS VAR. REFLEXA	ENDANGERED
AMARANTHACEAE	ACHYRANTHES SPLENDENS VAR. ROTUNDATA	ENDANGERED

WORKSHOP ON ENDANGERED OR THREATENED
HIGHER PLANTS OF THE UNITED STATES

Preparation of this report is the result of a joint undertaking between the Department of Botany in the Smithsonian Institution and the Office of Endangered Species and International Activities in the Department of Interior. The Smithsonian prepared the preliminary lists of endangered, threatened, and recently extinct species of plants, which were then submitted to a workshop held by the Institution with support from the Interior Department from 4 to 7 September 1974.

The participants in the workshop reviewed all plants on the preliminary lists. Full distribution, rarity, and endangerment were taken into account in determining the status of each entry. Based on all the information for each species that was entered on special data cards and computer listings, plus additional data cited by the participants (including information from state lists), the categories of "endangered," "threatened," "recently extinct or possibly extinct," or "unknown" were assigned to each species. A number of species were deleted because of recent taxonomic revisions or because the species was known to be common in some area or more widespread than previously known. Many unpublished data were used in making these determinations. The lists of endangered and threatened plant species, therefore, are presented as they were agreed upon by the participants in the workshop. The participants, reflecting a broad spectrum of eminent botanists, represented a wide range of institutions: Smithsonian Institution, Department of Interior, Department of Agriculture, National Science Foundation, Council on Environmental Quality, and major herbaria and arboretums.

As a result of the added information and the evaluations by participants in the workshop, all species on the preliminary lists have been categorized. A number of species were referred to specialists for the latest data on taxonomic status, distribution, abundance, and endangerment. The revised list then was circulated for final evaluation to these and other specialists and to compilers of some state lists.

Various botanists who have made special contributions that have been particularly valuable in specific plant groups include the following: Dr. E. S. Ayensu (Orchidaceae), Dr. R. C. Barneby (Astragalus), Dr. L. Benson (Cactaceae), Dr. L. Constance (Apiaceae, Hydrophyllaceae), Dr. A. Cronquist (Asteraceae), Lauramay Dempster (Galium), Dr. D. E. Fairbrothers, Dr. L. R. Heckard (Scrophulariaceae), Dr. D. Isely (Fabaceae), Dr. J. T. Mickel (ferns), Dr. P. H. Raven (Onagraceae), Dr. R. W. Read (Orchidaceae), Dr. J. L. Reveal (Eriogonum), Dr. R. C. Rollins (Brassicaceae), Dr. A. R. Smith (ferns), Dr. J. L. Strother (Asteraceae), Dr. R. L. Stuckey (Rorippa), Dr. R. Tryon (ferns), Dr. W. H. Wagner (ferns).

Many botanists from various states helped with data from state lists and local sources. It is impossible to list all of the botanists and other scientists who have assisted, but their kind help is appreciated in making these lists more valid and usable.

Following is a list of the invited participants in the workshop:

Dr. Edward S. Ayensu (Convener)
Chairman
Department of Botany
Smithsonian Institution
Washington, D. C. 20560

Dr. Ralph I. Blouch
Senior Wildlife Executive
Department of Natural Resources
Stevens T. Mason Building
Lansing, Michigan 48926

Ms. Joan E. Canfield
Museum Technician
Department of Botany
Smithsonian Institution
Washington, D. C. 20560

Dr. David Challinor
Assistant Secretary for Science
Smithsonian Institution
Washington, D. C. 20560

Mr. Thomas L. Cobb
Administrative Assistant, Forestry
National Parks and Conservation Association
1701 18th Street, N.W.
Washington, D. C. 20009

Mr. John E. Cooper
Director of Research and Collections
N. C. State Museum of Natural History
Jones and Halifax Streets
Raleigh, North Carolina 27611

Dr. Charles T. Cushwa
Staff, Range/Wildlife Scientist
Division of Forest Environment Research
Forest Service
U. S. Department of Agriculture
Washington, D. C. 20250

Dr. O. Keister Evans
Executive Director
American Horticultural Society
Mt. Vernon, Virginia 22121

Dr. F. Raymond Fosberg
Curator Department of Botany
Smithsonian Institution
Washington, D. C. 20560

Dr. Jerry F. Franklin
Program Director
Ecosystem Analysis
Division of Biology and Medicine
National Science Foundation
Washington, D. C. 20550

Ms. Margaret C. Gaynor
Special Assistant to the Secretary
Smithsonian Institution
Washington, D. C. 20560

Mr. Michael R. Huxley
Deputy Assistant Secretary for Science
Smithsonian Institution
Washington, D. C. 20560

Dr. Howard S. Irwin
President
New York Botanical Garden
Bronx, New York 10458

Dr. Dale W. Jenkins
Consultant for Endangered Flora Project
Department of Botany
Smithsonian Institution
Washington, D. C. 20560

Dr. Robert E. Jenkins
Vice President for Science
The Nature Conservancy
Rosslyn, Virginia 22209

Dr. Marshall C. Johnston
Director, Rare Plant Study Center
Department of Botany
University of Texas
Austin, Texas 78712

Dr. Porter M. Kier
Director
National Museum of Natural History
Smithsonian Institution
Washington, D. C. 20560

Dr. Robert Kral
Curator of Herbarium
Department of Biology
Vanderbilt University
Nashville, Tennessee 37203

Dr. Arthur R. Kruckeberg
Professor and Chairman
Department of Botany
University of Washington
Seattle, Washington 98195

Dr. Gerald A. Lieberman
Ecologist
The Nature Conservancy
Rosslyn, Virginia 22209

Dr. Elbert L. Little, Jr.
Chief Dendrologist
Forest Service
U. S. Department of Agriculture
Washington, D. C. 20250

Mr. Grenville L. Lucas
Senior Scientific Officer
Secretary, Threatened Plant Committee, IUCN
Royal Botanic Gardens
Kew, Richmond, Surrey, England

Dr. Ronald L. McGregor
Director, State Biological Survey of Kansas
University of Kansas
Lawrence, Kansas

Dr. James F. Mello
Assistant Director
National Museum of Natural History
Smithsonian Institution
Washington, D. C. 20560

Dr. Frederick G. Meyer
Taxonomist
National Arboretum
U. S. Department of Agriculture
Washington, D. C. 20002

Dr. J. K. Morton
Professor and Chairman
Department of Biology
University of Waterloo
Waterloo, Ontario, Canada
N2L 3G1

Dr. Robert Ornduff
Director of Botanical Garden
University of California
Berkeley, California 94720

Mr. Frank Potter
Majority Counsel
Office of the House Merchant Marine Committee
1334 Longworth Building
Washington, D. C. 20515

Dr. W. Robert Powell
Director, CNPS Rare Plant Project
Department of Agronomy and Range Science
University of California
Davis, California 95616

Dr. James L. Reveal
Associate Professor
Department of Botany
University of Maryland
College Park, Maryland 20901

Dr. Jack E. Schmautz
Staff Specialist of Range Ecology
Division of Range Management
Forest Service
U. S. Department of Agriculture
Washington, D. C. 20250

Dr. Thomas N. Shiflet
Chief Range Conservationist
Soil Conservation Service
U. S. Department of Agriculture
Washington, D. C. 20250

Dr. Ronald O. Skoog
Chief, Office of Endangered Species and
International Activities
Fish and Wildlife Service
U. S. Department of Interior
Washington, D. C. 20240

Dr. Dixie R. Smith
Principle Range/Wildlife Scientist
Division of Forest Environment Research
Forest Service
U. S. Department of Agriculture
Washington, D. C. 20250

Major James Stevenson
Chief Naturalist
Division of Recreation and Parks
Department of Natural Resources
Tallahassee, Florida 32304

Dr. Lee M. Talbot
Senior Scientist
Council on Environmental Quality
Washington, D. C. 20006

Dr. Warren H. Wagner, Jr.
Professor and Curator
Department of Botany
University of Michigan
Ann Arbor, Michigan 48104

Dr. Daniel B. Ward
Curator, The Herbarium
Department of Botany
University of Florida
Gainesville, Florida 32601

Dr. Carroll E. Wood, Jr.
Professor of Biology and
Curator of the Arnold Arboretum
Harvard University
Cambridge, Massachusetts 02138

Dr. John J. Wurdack
Curator
Department of Botany
Smithsonian Institution
Washington, D. C. 20560

COORDINATION

The U. S. Department of Agriculture has undertaken considerable activity with respect to endangered and threatened plants. For several years the U. S. Forest Service has listed rare and endangered plants that occur in the National Forests. These lists have been made available to the Smithsonian Institution. The Forest Service also has made a detailed analysis of the rare and endangered trees of the United States and has determined their exact distributions and status. The National Arboretum has an interest in rare and endangered plants, especially ornamentals and other species of direct value to man. The Soil Conservation Service, also concerned about endangered and threatened species of higher plants, has contributed to the program in the Department of Agriculture.

Canada is developing a list of endangered and rare plants. At the Smithsonian workshop the chairman of the Canadian Committee on Rare and Endangered Plants reviewed the progress on the list from his own country. Canadian and American efforts will be coordinated closely.

After these lists are presented to Congress, they will be submitted for inclusion in the *Red Data Book*, Volume 5: *Angiospermae*, published by the International Union for Conservation of Nature and Natural Resources, under the aegis of its Survival Service Commission, which has established a Threatened Plants Committee. This Committee is developing a world list of endangered and vulnerable flowering plants that is being issued at intervals in its *Red Data Book*.

The methods developed by the United States, including computerization of the present list, should prove to be of great value in developing this world

list. Thus, the United States, in carrying out the provisions of the Endangered Species Act of 1973 will be able to assist countries throughout the world to preserve valuable plant species--hopefully before much more extinction occurs.
